

## Persistent Drought Across Iberian Peninsula and Northwest Africa

Valid: November 2025 (ongoing)

### Affected Areas

South-western Spain; Portugal; northern Morocco; northern Algeria.

### Hazard Types

Severe soil moisture deficit, low water availability, agricultural/ecosystem stress, high wildfire risk.

### Summary

Warm and dry autumn 2025 led to widespread drought across south-western Iberia and Northwest Africa. Conditions remain severe with accumulated rainfall deficits and declining soil moisture, placing ongoing pressure on water resources, agriculture, and ecosystems. Monitor reservoirs and fire risks closely.
