

Jan 14, 2026

Heavy Rainfall - Spain

Affected Areas

Northwestern Spain, mainly Galicia (A Coruña, Lugo, Ourense, Pontevedra) and parts of Asturias and Castilla y León (León, Zamora), with higher impacts near the Atlantic coast and adjacent mountainous areas.

Duration

January 14-17, 2026

Hazard Types

Heavy Rain, Coastal Flooding, Damaging Winds, Storm Surge, Landslides

Hazard Summary

A strong Atlantic wind convergence system along the western coast is driving moist onshore winds, leading to persistent cloud formation and intense rainfall. The associated strong winds enhance coastal flooding and storm surge, while prolonged soil saturation increases landslide risk.
