Global Alerts - Centre Zone

Rising Temperature Warning – Switzerland

Duration

May 28 – June 03, 2025

Hazard Types

Avalanche

Hazard Summary

Significantly elevated temperatures are observed across the Swiss Alps, with widespread areas experiencing temperatures above 10°C, even at high altitudes. This unseasonal warmth will rapidly accelerate snowmelt and destabilize the snowpack in mountainous regions. The risk of wet snow avalanches is heightened, especially on sun-exposed slopes and near steep terrain. All concerned authorities and the public are advised to remain vigilant, restrict travel in avalanche-prone areas, and closely monitor updates from official Swiss avalanche and weather services.
