Extremely Heavy Rainfall Alert – Bangladesh

Duration

May 30 – June 01, 2025

Hazard Types

Extreme Rainfall

Hazard Summary

An extreme precipitation event is impacting Bangladesh, with heavy to very heavy rainfall observed over central and southern regions, including Dhaka, Chandpur, Noakhali, and Nangalkot. Currently a deep depression is approaching the coastal delta of Bangladesh and has tendency to become a cyclonic system, causing intense moisture inflow and convection. The resulting rainfall poses serious risks of urban flooding, flash floods, and riverine inundation. Coastal and low-lying areas are particularly vulnerable. Authorities and the public are urged to take immediate precautions, avoid non-essential travel, and follow updates from the Bangladesh Meteorological Department. Alerts are also uploaded in NDMA website.
