The National Disaster Management Authority (NDMA) is the lead federal agency to deal with the whole spectrum of Disaster Management in Pakistan. It was established in 2007 through NDM Ordinance and was finally provided parliamentary cover by an act of Parliament in 2010. The NDMA is the executive arm of the National Disaster Management Commission (NDMC), which was established under the Chairmanship of the Prime Minister of Pakistan, as an apex policy making body in the field of Disaster Management. The NDMA aims to develop sustainable operational capacity and professional competence to coordinate the emergency response of Federal Government in the event of a national disaster.

FOREWARD

The primary goal of the National Disaster Management Authority (NDMA) is to achieve sustainable social, economic and environmental development in Pakistan through reducing risks and vulnerabilities by effectively responding to and recovery from all types of disasters.

Pakistan is among the countries most vulnerable to natural and man-made disasters. The country's acute vulnerability to disasters is due to its geographical location, diverse topography, hydrological configuration and extended fault-lines. The recurrent disasters have taken a heavy toll on the long-term sustainability of the country. The vulnerability to disasters is growing in both urban and rural areas, placing even more lives and livelihoods at risk.

NDMA, being the country's apex body for implementing, coordinating and monitoring whole spectrum of disaster management activities in Pakistan, has always remained focused to achieve its vision of building disaster resilient Pakistan. Significant efforts have been made in this direction to reduce the country's vulnerability to several impending disasters. National Disaster Management Plan (NDMP) 2012-2022 reflects our priorities i.e. adopting a proactive approach towards disaster risk management. For implementation of NDMP's key interventions, NDMA conceived an implementation roadmap for NDMP (2016-2030) wherein particular emphasis has been laid on Multi Hazard Vulnerability & Risk Assessment (MHVRA) Intervention.

MHVRA study plays an instrumental role in integrated Disaster Risk Reduction (DRR) planning and mainstreaming DRR into development at local, provincial, and national level. It guides the relevant agencies/ line departments in requisite land-use planning and implementation of national scale programs aligned to vulnerabilities at a community level. The knowledge gain from the study can also play a cardinal role in development of robust knowledge management framework for long-term socio-economic sustainable growth.

For MHVRA related activities, NDMA has raised Project Management Unit (PMU). I am delighted to know that PMU has successfully conducted the MHVRA study of five selected districts of Punjab by utilizing the in-house technical resources. It is noteworthy to mention that this Project is first of its kind and demonstrates high degree of expertise for data processing and visualization. I am very much satisfied with the results and hope this document will act as a constant source for informed decision making for all stakeholders. I would like to extend my gratitude to the Members of NDMP Steering Committee for taking keen interest in guiding the project team throughout the course of this Study and endorsing its results.

I would like to place on record my sincere appreciation for the contributions of Development Partners, NGOs/INGOs and academia for their valuable inputs during the execution of this Study. A profound gratitude goes to the United Nation World Food Program, Pakistan for their support and cooperation for initiating and pioneering MHVRA initiatives in Pakistan and for their long-term support in establishing PMU in NDMA.

Last but not the least, the Project was also meant for development of NDMA in-house capacity to take similar endeavors in the future as well and with the Blessing of Almighty Allah we have been able to cover a lot of mileage. I believe, this is the first step for a long journey ahead which requires a steadfast and consistent efforts which for contributions of partners will be highly appreciated.

Lieutenant General
Omar Mahmood Hayat, HI (M)
Chairman, National Disaster
Management Authority (NDMA)

ACKNOWLEDGEMENT

The National Disaster Management Authority (NDMA) is pleased to launch the Multi Hazards Vulnerability and Risk Assessment (MHVRA) Atlas of five selected districts of Punjab, prepared mainly as a dynamic planning tool for Disaster Risk Management (DRM) officials of Government, Humanitarian Agencies and Development Partners at provincial and district levels for improved and informed Disaster Risk Reduction (DRR), Preparedness and Contingency Planning.

An esteem of gratitude is owed to the Former Chairman NDMA, Major General (R) Asghar Nawaz HI(M) and the Current Chairman Lieutenant General Omar Mahmood Hayat HI(M), for their visionary approach, guidance and direction in constituting this Study. They remained a source of guidance at each stage of this project which ultimately had resulted in successful execution of this Project..

We profoundly acknowledge Senior DRM Officer, Mr. Sultan Mehmood of Disaster Risk Reduction (DRR) Unit and Program Officer Mr. Iftikhar Abbas of Vulnerability Analysis & Mapping (VAM) Unit of World Food Program (WFP) for their support and cooperation for all our initiatives and endeavors throughout the working of this project. We acknowledge and express our sincere and deep appreciation for their assistance in this regard.

Our sincere and passionate felicitations to Former Member Disaster Risk Reduction (DRR) NDMA, Mr. Ahmed Kamal, Current Member DRR, NDMA, Mr. Idrees Mehsud, Director Implementation Lieutenant Colonel (R) Raza Iqbal and Assistant Director Projects Mr. Shafi Agha for their continuous support, prized guidance and relevant inputs based on their vast experience and knowledge that contributed immensely in this endeavor.

We acknowledge significant contributions made by institutions and individuals at district, provincial, national by providing data and information required to smoothly carryout this project. In addition, the proficiencies provided by the consultant of different disciplines were crucial, as it helped to maintain precision throughout the assessment.

In the end, we would like to extend our heartiest gratitude to all our relevant stakeholders who rendered their full support, contribution and active participation during execution of this Study. Their contributions are sincerely appreciated and acknowledged.

PREFACE

Pakistan by virtue of its diverse topographic features is vulnerable to wide degree of natural and man-made disasters. Events exhibited under many forms in the past are the testimonies to the country's susceptibility to disasters. Until recently, a reactive emergency response approach remained chiefly applicable to deal with disasters in Pakistan. However, disasters continued to exact a heavy toll on country's economy, human lives and environment and, consequently, manifested the need for developing a different strategy towards Disaster Risk Management (DRM). Against this backdrop, a shift from hitherto response based approach to proactive disaster management was adopted through 2007 National Disaster Management Ordinance, now known as National Disaster Management (NDM) Act 2010.

National Disaster Management Authority (NDMA), with provision of NDMA Act 2010 and in-line with the DRR Policy, formulated a 10-year comprehensive National Disaster Management Plan (NDMP) 2012–2022 outlining ten priority areas and 118 specific interventions and projects for implementation over the span of ten years. The priority number three and four under NDMP 2012–2022 warrant execution of Multi Hazard Vulnerability and Risk Assessment (MHVRA) Intervention in the Country. In this regard, a roadmap i.e. NDMP implementation roadmap 2016–2030 was chalked out for phase-wise execution of MHVRA Intervention at micro level, down to UC Level, for all districts of Pakistan and AJ&K.

In view of the Country's vulnerability to multiple disasters, the implementation of MHVRA Intervention is considered essential for achieving national and global commitments, some of those outlined in Millennium Development Goals (MDGs) & Sustainable Development Goals (SDGs), Sendai Framework for Disaster Risk Reduction (SFDRR), Climate Change Policy 2012, National Disaster Risk Reduction (DRR) Policy 2013, NDMP 2012–2022 and Pakistan Vision 2025.

Cognizance of the importance of MHVRA component, NDMA, being an apex body to deal with the whole spectrum of disaster management, embarked upon establishing holistic and well-structured methodology for country-specific MHVRA activity. To this end, Project Management Unit (PMU) has been established in NDMA for execution and monitoring of the MHVRA Studies in the Country, with an aim to clearly estimate and map the risk of communities nationwide. PMU, as the first step, laid down "NDMA Policy & Execution Guidelines for the conduct of MHVRA" to maintain unanimity in risk assessment methodology across the Country and AJ&K. The Guidelines constitute an important part of NDMA's effort towards provision of unified standards and procedures for the hazard, exposure, vulnerability and risk assessments.

To test the various attributes of the MHVRA Guidelines, PMU with the support of World Food Programme (WFP), conducted a micro-level MHVRA intervention, down to the level of Union Council, for selected five districts of Punjab namely Bahawalpur, Jhang, Khushab, Multan and Rahim Yar Khan. This Project has a distinction of being the only study to be endorsed by Steering Committee formulated to oversee implementation of NDMP. The NDMP Steering Committee consists members from all lead technical agencies of Pakistan including representatives from S/GB/F/PDMA, Pakistan Meteorological Department (PMD), Planning Commission, Planning Development & Reforms Division, Finance Division, Economic Affairs Division, Ministry of Water & Power, Ministry of Climate Change, Federal Flood Commission (FFC), Geological Survey of Pakistan (GSP), Space & Upper Atmosphere Research Commission (SUPARCO) and Survey of Pakistan (SOP) as well as representatives from academia.

This Study involved identification and analysis of prevailing hazards in the study districts through field level consultation with local stakeholders and analysis of historical records. Three hazards namely drought, flood, earthquake have been considered for hazard analysis owing to their frequent recurrence in the study districts. The project covered various scientific and technical activities, including a review of past and ongoing studies related to hydrological, seismological and geological phenomenon. For hazard modelling and analysis, probabilistic and scenario based hazard assessment tools have been employed in the project. Technical parameters used for hazard estimation include information concerning soil moisture condition, climatic, biotic & edaphic factors of soil, temperature condition, vegetation health, water flow paths, flood catchment area, streamline data, land use data, river discharge information, flood extent, flood velocity, precipitation, seismic sources, plate tectonics, geomorphology, soil data, bore hole data, fault zones, ground motion prediction equations, seismic intensity (PGA), soil ground motion amplification factor and so on.

Exposure have been mapped in the dimensions of population, physical elements, life lines, essential facilities, transportation facilities, socio-economic aspects, economic activities, environmental elements, critical infrastructure, agriculture and livestock elements; being termed as elements at risk. Various statistical tools such as projection equations, dissimilarity index, have been employed in the Project to extrapolate information beyond the available frame.

Vulnerability analysis have been conducted considering three dimensions i.e. physical, social and agriculture (Food Insecurity). For physical vulnerability, fragility curves have been developed using available technical and statistical tools (Probabilistic or Empirical fragility models). For social vulnerability, several technical tools such as Principal Component Analysis (PCA) and Social Vulnerability Indicator (SoVI) have been utilized to obtain possible driving factors contributing to the social vulnerability in the study area. Vulnerability analysis in the context of agriculture and food security have also been undertaken to determine sets of contributing factors to food insecurity and agricultural vulnerability. The stressor covered epidemic, endemic, biotic and edaphic factors and sudden shocks such as earthquake, flood and drought.

Coping capacity has been anticipated by assessing existing capacities of organization to manage disasters. The coping capacity has further been divided into three main factors i.e. capacity to anticipate risk, capacity to respond and capacity recover. Adaptive capacity has been evaluated using fifteen indicators.

For Risk Assessment, Analytical Hierarchy Process (AHP) and Multi Criteria Decision Making approaches have been employed in the Study. The risk assessment has been carried out using qualitative, quantities or semi quantitative approach. On basis of these factor components, the cumulative risk profile of the study districts (risk indexing down to UC Level) have been developed. Various DRR intervention and mitigation measures have formulated and finally Cost Benefit Analysis (CBA) of proposed DRR interventions have been performed to estimate their economic feasibility.

(Continued)

Close linkages with the National, provincial and district organizations have been established through stakeholder consultation arrangements in order to facilitate secondary data collection, hazard specific information exchange, and sharing of any other relevant data. For this purpose, several data collection tools have been utilized in the Study such as focus group discussion, key informant interviews, participatory rural appraisal, semi structured interviews and one-to-one interviews with community level stakeholders and line departments.

ABOUT THIS ATLAS

An accurate, easy-to-interpret and up-to-date information is one of the most fundamental elements of decision-making process. Information, particularly in the realm of disaster management, plays an instrumental role in the risk-informed Disaster Risk Reduction (DRR) planning. It makes the relevant departments aware of the likely losses, relative vulnerabilities, exposure and impending disaster risks in the study area, enabling them to effectively undertake prevention, mitigation, preparedness and response based measures before or at the onset of any emergency situation. However, compilation and visualization of information concerning Multi Hazard Vulnerability & Risk Assessment (MHVRA) study is fairly a challenging task since it demands multi-dimensional analysis of different natural processes to understand their composite effects over the study area. Similarly, presentation of the outputs of MHVRA study to the end user, in an easy manner, is yet another challenging task, which requires development of data visualizing tools, graphic aids, catalog of charts and map composition with effective cartographic language. This Atlas is one major step to achieve the said objectives. Much effort has been put in to provide easy to comprehend and interactive information to the users.

This Atlas provides detailed baseline maps of the study district covering several dimensions to include geology, climatology, land use, land cover, elevation, population, settlements, buildings, transportation, telecommunication, health, education, irrigation infrastructure, industries, livestock, agriculture etc. Several graphical tools have been employed to produce easy to grasp charts, these include pie-charts, histograms, ring charts, matrix diagram, bar charts, line graphs, 3D charts and informative tables. The Atlas also provides brief hazard assessment methodologies for each selected hazards i.e. drought, earthquake and flood, along with maps for various return periods. Exposure Matrix Tables identifying the exposed elements at risk have also been developed along with the exposure maps. A brief risk assessment methodology is also provided in the atlas with the risk maps. All the study has been conducted at micro-level, down to the level of Union Council. This Study is first of its kind and demonstrates high level of expertise, arduous work and coordinated approach involving cross-sectorial stakeholder linkages.

The Product shall be useful for policymakers and practitioners for risk-informed land-use planning, mainstreaming DRR into development programs and implementation of national scale programs aligned to ground. The project would render substantial baseline information over which other micro level DRR plans could be devised and will serve as a state of the art planning tool enabling mapping of resources in the study district.

List of Officers/Officials involved in MHVRA Punjab Study

Technical Team

Name	Designation/Position
Mr. Ehtisham Khalid Khan	Project Director / Team Lead
Ms. Nimrah Khalid	MHVRA Expert
Mr. Asif Jan Turangzai	Senior MHVRA Expert (Till October, 2016)
Mr. Saad Shams Butt	GIS Expert (Till September, 2016)
Mr. Syed Muhammad Tayyab Shah	Project Officer
Mr. Aamir Qayyum	Project Officer
Ms. Mashal Riaz	MHVRA Officer
Ms. Sana Zahid Shah	GIS Officer
Ms. Zahra Hassan	GIS Officer
Mr. Ismail Khan	Project Officer (Till September, 2016)
Mr. Malik Zaheer-ud-Din	Project Officer (Till August, 2016)
Ms. Sarah Ovais	GIS Associate (Till September, 2016)
Ms. Saman Mushtaq	GIS Associate (Till September, 2016)
Mr. Muhammad Waqas	MHVRA Associate (Till February, 2017)
Mr. Sheikh Rafay Ehsan	MHVRA Intern

Consultants

Name	Consultancy Area
Dr. Naveed Ahmad	Seismic Hazard Analysis and Vulnerability Analysis
Dr. Bashir Ahmad	Drought Hazard Analysis
Dr. Athar Ashraf	Flood Hazard Analysis
Dr. Wajid Pirzada	Food Insecurity Study
Dr. Shahzad Ali Khan	Cost & Benefit Analysis
Mr. Amjad Ahmad	Risk Assessment

Support Team

Name	Designation/Position
Ms. Muqaddas Iqbal	Project Coordinator (Till September, 2016)
Mr. Ghulam Rasool	Admin and Account Officer
Mr. Shahid Malik	Field Surveyor
Mr. Ali Tassadaq	Account Intern (Till February, 2017)
Mr. Tilwat Khan	Office Assistant
Mr. Nasir Khan	Office Assistant

National Disaster Management Plan (NDMP)

Steering Committee - Participants List (19th Sep & 9th Dec 2016)

Name	Designation	Position	Department
Maj. Gen. Asghar Nawaz	Chairman	Chair	National Disaster Management Authority (NDMA), Pakistan
Mr. Ahmed Kamal	Member (Disaster Risk Reduction)	Member/ Secretary	
Brig. Ishtiaq Ahmed	Member (Operations)	Member	
Mr. Ehtisham Khalid Khan	Project Director/Team Lead	Member	
Mr. Chaudhry Muhammad Anwar	Chief (PPH)	Member	Planning and Development Division
Mr. Syed Zawad Haider Shah	Section Officer	Member	Economics Affairs Division
Mr. Syed Zakria Ali Shah	Deputy Secretary (UN)		
Mr. Muhammad Saleem Khatak	Deputy Secretary	Member	Ministry of Climate Change
Mr. Wasim Akhtar	Deputy Secretary (Development)		
Mr. Muhammad Afzal Shabzada	Deputy Director		
Mr. Arshad Ahmed	Senior Joint Secretary	Member	Finance Division
Mr. Malik Aman	DSA (NDMA)		
Mr. Khalid Sher Dil	Director General	Member	Provincial Disaster Management Authority, Punjab
Mr. Hameedullah Malik	Project Director		
Mr. Nisar Ahmed Sani	Documentation Officer		
Mr. Syed Ahmed Fawad	Director (Operations)	Member	Provincial Disaster Management Authority, Sindh
Mr. Amer Afaq	Director General	Member	Provincial Disaster Management Authority, Khyber Pakhtoonkha
Mr. Wajid Ali Khan	Deputy Director (Relief)		
Mr. Israr Muhammad	Director (R&R)		
Mr. Faisal Khan Baloch	Assistant Director	Member	Provincial Disaster Management Authority, Balochistan
Mr. Muhammad Khalid Sherdil	Director General	Member	FATA Disaster Management Authority
Mr. Main Adil Zahoor	Assistant Director (Operations & Relief)		
Mr. Zaheer-udin-Babar	Deputy Director	Member	Gilgit Baltistan Disaster Management Authority
Mr. Abdul Waheed Shah	Director General		
Mr. Zaheer-udin-Qureshi	Director General	Member	State Disaster Management Authority Azad Jammu & Kashmir
Dr. Muhammad Hanif	Director (NWFC)	Member	Pakistan Meteorological Department
Mr. Zafar Iqbal	Senior Engineer	Member	Federal Flood Commission, Ministry of Water and Power
Mr. Alamgir	Chief Engineer		
Mr. Muhammad Ishtiaq	Director	Member	Survey of Pakistan
Mr. Syed Zuhair Bukhari	Director	Member	Pakistan Space and Upper Atmosphere Research Commission (SUPARCO)
Mr. Zafar Iqbal	Director		
Mr. Muhammad Farooq	General Manager		
Mr. Sardar Saeed Akhter	Director	Member	Geological Survey of Pakistan
Mr. Simon Sadiq	Deputy Director		
Brig Sajid Naeem (R)	Senior Capacity Building Expert	Member	National Institute of Disaster Management
Dr. Talat Iqbal	Deputy Chief Scientist / Director	Co-opted Member	Center for Earthquake Studies, PAEC
Dr. Muhammad Ali Shah	Manager (DM & R Division)	Co-opted Member	Micro Seismic Studies Program, Pakistan Atomic Energy Commission (MSSP,PAEC)
Mr. Thi Van Hoary	Head of Vulnerability Analysis & Mapping	Observer	World Food Program, Pakistan (UN- WFP)
Mr. Iftikhar Abbas	Program Officer (Spatial Analyst)		
Ms. Umber Khan	Program Officer	Observer	Department for International Development (DFID)
Mr. Sherwan Asif	Program Manager		
Mr. Shaukat Shafi	Senior Project Officer	Observer	Asian Development Bank (ADB)

GLOSSARY OF TERMS

Acceptable Risk	The level of potential losses that a society or community considers acceptable given existing social, economic, political, cultural, technical and environmental conditions.
Accountability	Obligation to demonstrate that work has been conducted in compliance with agreed rules and standards or to report fairly and accurately on performance results vis a vis mandated roles and/or plans. This may require a careful, even legally defensible, demonstration that the work is consistent with the contract terms.
Activity	Actions taken or work performed through which inputs, such as funds, technical assistance and other types of resources.
Adaptation	The adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities.
Affected Area	An area or part of country affected by disaster.
Alluvium Deposits	A deposit of clay, silt, and sand left by flowing floodwater in a river valley or delta, typically producing fertile soil.
Avalanche	An avalanche (also called a snow slide) is a rapid flow of snow down a sloping surface of a mountain. Avalanches are triggered due to mechanical failure of the snow when the forces on the snow exceed its cohesion strength.
Average Household Size	Average Number of persons per household.
Bare Area with Sparse Natural Vegetation	Sand Dunes with natural vegetation, bare rocks (with sparse vegetation) and desert flat plains are included in this class.
Bare Areas	This class describes areas that have very less natural and manmade vegetation cover which include sand dunes and barren land.
Base-Line Study	An analysis describing the situation prior to a development intervention, against which progress can be assessed or comparisons made.
Basic Health Unit (BHU)	The BHU is located at a Union Council and serves a catchment population of up to 25,000. Services provided at BHU are promotive, preventive, curative and referral. BHU provides all PHC services along with integral services that include basic medical and surgical care. MCH services are also part of the services package being provided at BHU. BHU provides first level referral to patients referred by LHWs. BHU refers patients to higher level facilities as and when necessary.
Built-up Area	It defines all built areas (urban, industrial, airport etc.) with all vegetated areas linked to the built-ups such as gardens, golf courses, urban recreation parks, plots devoted to urban expansion etc.
Capacity	The combination of all the strengths, attributes and resources available within a community, society or organization that can be used to achieve agreed goals.
Capacity Building	Efforts aimed to develop human skills or societal infrastructure within a community or organization needed to reduce the level of risk. In extended understanding, capacity building also includes development of institutional, financial, political and other resources, at different levels of the society.
Census	Census is an official count or a survey, especially of a population.
Climate Change	(a) The Inter-governmental Panel on Climate Change (IPCC) defines climate change as: "a change in the state of the climate that can be identified (e.g., by using statistical tests) by changes in the mean and/or the variability of its properties, and that persists for an extended period, typically decades or longer. Climate change may be due to natural internal processes or external force or to persistent anthropogenic changes in the composition of the atmosphere or in land use". (b) The United Nations Framework Convention on Climate Change (UNFCCC) defines climate change as "a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods".
Climatology	Climatology or climate science is the scientific study of climate, scientifically defined as weather conditions averaged over a period of time.
Coping Capacity	The means by which people or organizations use available resources and abilities to face a disaster. In general, this involves managing resources, both in normal times as well as during crises or adverse conditions.
Craton	The term craton is used to distinguish the stable portion of the continental crust from regions that are more geologically active and unstable. Cratons can be described as shields, in which the basement rock crops out at the surface, and platforms, in which the

basement is overlaid by sediments and sedimentary rock.

Critical Facilities	The primary physical structures, technical facilities and systems which are socially, economically or operationally essential to the functioning of a society or community, both in routine circumstances and in the extreme circumstances of an emergency.
Crop Irrigated	Areas used for the production of annual crops, such as corn, vegetables, soybeans, tobacco and cotton. This class also includes all land being actively tilled.
Crop Marginal and Irrigated Saline	Crop marginal and irrigated saline are identified as those areas which are currently used for agriculture with low and unstable rainfall or higher rainfall areas intensively used, relative to user capability, under existing population densities, traditional technologies and institutional structures.
Crop Rainfed	The term rainfed agriculture is used to describe farming practices that rely only on rainfall for water.
Cyclone	A large-scale system of winds that spiral in toward a region of low atmospheric pressure. Because low-pressure systems generally produce clouds and precipitation, cyclones are often simply referred to as storms. A tropical cyclone is one that forms over warm tropical waters. Such a system is characterized by a warm, well-defined core and can range in intensity from a tropical depression to a tropical cyclone. While tropical cyclones can produce extremely powerful winds and torrential rain, they are also able to produce high waves and damaging storm surge.
Debris Flow	This is a phenomenon in which soil and rock on the hillside or in the riverbed are carried downward at a dash under the influence of continuous rain or torrential rain.
Demographics	It is the statistical data relating to the population and particular groups within it.
Density	Density refers to number of elements (population, buildings, roads etc.) per unit area.
Disaster	<p>A catastrophe or a calamity in an affected area arising from natural or man-made causes or by accident which results in substantial loss of life or human suffering or damage to, and destruction of property.</p> <p>A serious disruption of the functioning of a community or a society involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources.</p>
Disaster Management	Managing the complete spectrum of disaster including preparedness, mitigation, response, recovery, relief and rehabilitation.
Disaster Risk	The potential disaster losses, in lives, health status, livelihoods, assets and services, which could occur to a particular community or a society over some specified future time period.
Disaster Risk Management (DRM)	The systematic process of using administrative directives, organizations, and operational skills and capacities to implement strategies, policies and improved coping capacities in order to lessen the adverse impacts of hazards and the possibility of disaster.
Disaster Risk Reduction (DRR)	The concept and practice of reducing disaster risks through systematic efforts to analyses and manage the causal factors of disasters, including through reduced exposure to hazards, lessened vulnerability of people and property, wise management of land and the environment, and improved preparedness for adverse events.
District Head Quarter (DHQ)	The District Head Quarters (DHQ) Hospital is located at District headquarters level and serves a population of 1 to 3 million, depending upon the category of the hospital. The DHQ hospital provides promotive, preventive, curative, advance diagnostics, inpatient services, advance specialist and referral services. All DHQ hospitals are supposed to provide basic and comprehensive care.
Drought	A drought is an extended period when an area notes a deficiency in its water supply when the demand for water exceeds the supply. Generally, this occurs when an area receives consistently below average precipitation. It can have a substantial impact on the ecosystem and agriculture of the affected region.
Early Warning	The provision of timely and effective information, through identified institutions, to communities and individuals so that they could take action to reduce their risks and prepare for effective response.
Earthquake	Earthquake is defined as shaking and vibration at the surface of the earth resulting from underground movement along a fault plane of from volcanic activity or due to movement of plate boundaries of the Earth. The scale of earthquakes is measured by moment magnitude and the shaking intensity at each location is usually reported by Mercalli intensity scale.
Effectiveness	The extent to which the development intervention's objectives were achieved, or are expected to be achieved, taking into account their relative importance.
Efficiency	A measure of how economically resources/inputs (funds, expertise, time, etc.) are converted to results.
Element at Risks	Elements at Risk include all tangible (population, essential and critical infrastructure, building, crops and so on) and intangible elements (monetary values) that are at risk to any potential damage during extreme events.
Elevation	The measurement of height of a surface above sea level or ground level.

Emergency Management	The management and deployment of resources for dealing with all aspects of emergencies, in particularly preparedness, response and rehabilitation.
Employment	The “employed” comprises all persons ten years of age and above who worked at least one hour during the reference period and were either “paid employed” or “self-employed”. Persons, employed on permanent/regular footings, who have not worked for any reason during the reference period are however, treated as employed.
Entity	Any government or non-government organization, national or international stakeholders including Federal, Provincial and District agencies and United Nations’ agencies relevant to Disaster Management as described in Section 23-2 [(a) and (d)] of NDM Act 2010, which is interested in the execution of MHVRA activity hereinafter referred to as Entity.
Eolian Deposits	Eolian Deposits are the Wind-blown deposits on Planetary surface.
Evaluation	The systematic and objective assessment of an on-going or completed project, program or policy, its design, implementation and results. The aim is to determine the relevance and fulfillment of objectives, development efficiency, effectiveness, impact and sustainability. An evaluation should provide information that is credible and useful, enabling the incorporation of lessons learned into the decision making process of both recipients and donors.
Evaporites	Evaporites are individual minerals found in the sedimentary deposit of soluble salts that results from the evaporation of water.
Exposure	People, property, systems, or other elements present in hazard zones that are subject to potential losses.
Flash Flood	A flash flood is a phenomenon of rapid flooding (mostly less than 6 hours) of geomorphic low-lying areas due to downpour or heavy rains caused by low depression, climate front line (thunderstorm) or cyclone.
Flood	Flood is a phenomenon of inundation by water coming from a direct rainfall or river, drainage or other water bodies, such as lakes or seas due to overflowing from ordinary boundary between land and water or water surging.
Flood Plain Deposits	Floodplain deposits are also called as Alluvial Plain, flat land area adjacent to a stream, composed of unconsolidated sedimentary deposits (alluvium) and subject to periodic inundation by the stream.
Food Insecurity	The state of being without reliable access to a sufficient quantity of affordable and nutritious food.
Forecast	Estimate of the occurrence of a future event (UNESCO, WMO). The term is used with different meanings in different disciplines.
Geography	Geography is the study of the Earth and its features, its inhabitants, and its phenomena.
Geological Composition	Geological composition is the fundamental unit of lithostratigraphy that contain certain amount of rock strata that have a comparable lithology, facies or other similar properties.
Geology	Geology is an earth science concerned with the solid Earth, the rocks of which it is composed and the processes by which they change over time.
Geospatial Data Bank	Spatial Data and Geographic Information Management System (GIS) data relevant to disaster and the corresponding data integration in the form of geospatial data bank. In the context of disaster management, following types of data is required: <ul style="list-style-type: none"> i. Data on the disastrous phenomena (e.g. landslides, floods, earthquakes), their location, frequency, magnitude etc. ii. Data on the environment in which the disastrous events might take place: topography, geology, geomorphology, soils, hydrology, land use, vegetation etc. iii. Data on the elements that might be destroyed if the event takes place: infrastructure, settlements, population, socioeconomic data etc. iv. Data on the emergency relief resources, such as hospitals, fire brigades, police stations, warehouses etc.
GLOF	“GLOF” refers to a Glacial Lake Outburst Flood that occurs when water in a glacier lake suddenly discharges due to a breach of a moraine dam (glacier lake). The results can be catastrophic to the downstream riparian area. (Richardson and Reynolds 2000).
Hazard	A dangerous phenomenon, substance, human activity or condition that may cause loss of life, injury or other health impacts, property damage, loss of livelihoods and services, social and economic disruption, or environmental damage.
Hazard Analysis	Identification, studies and monitoring of any hazard to determine its potential, origin, characteristics and behavior.
Hill Torrent (Flood)	Hill torrent floods are basically a rapid flooding of geomorphic steep surface areas at alluvial cones or floodplain areas caused by overflowing water from channels due to rapid velocity and any amount of flow quantity.
Household	A household is defined to be constituted of all those persons who usually live together and share their meals. A household may consist of one person or more than one person who may or may not be related to each other.
Human-Induced Disasters	Natural disasters that are accelerated/ aggravated by human influence. A landslide, for example, may be purely natural, as a result of a heavy rainfall or earthquake, but it may also be human induced, as a result of an over steepened road-cut.

Human-Made Disasters	Events which are caused by human activities (such as atmospheric pollution, industrial chemical accidents, major armed conflicts, nuclear accidents, oil spills etc.)
Impacts	Positive and negative, primary and secondary long-term effects produced by a development intervention, directly or indirectly, intended or unintended.
Indicators	Indicators are variables or parameters used to describe drought conditions. Examples include precipitation, temperature, streamflow, groundwater and reservoir levels, soil moisture, snowpack, etc.
Indices	Indices are typically a computed numerical representation of drought severity, assessed using climatic or hydro-meteorological inputs including the indicators listed above. In short, they aim to measure the qualitative state of drought on the landscape for a given time period. Indices are technically indicators as well. Monitoring the climate at various timescales allows identification of short-term wet periods within long-term droughts or short-term dry spells within long-term wet periods.
Infant Mortality Rate	The number of deaths of infants under one year of age per 1000 live births in a given year.
Irrigated Area	Irrigated agricultural area refers to the area in which the moisture of soil is controlled for the better growth of seeds and better crop production by providing water through different mode of water supply such as rivers, major, minor or distributary canals, tube wells, wells, spraying or other water to the crops.
Irrigation Sources	It refers to the source(s) by means of which the cultivated area is irrigated partially or wholly.
Land Cover	Land Cover is defined as the observed (bio) physical cover on the earth's surface.
Land Use	Land Use is characterized by the arrangements, activities and inputs that people undertake in a certain type of land in order to produce, change or maintain it.
Land Use Planning	The process undertaken by public authorities to identify, evaluate and decide on different options for the use of land, including consideration of long term economic, social and environmental objectives and the implications for different communities and interest groups, and the subsequent formulation and promulgation of plans that describe the permitted or acceptable uses. Land-use planning can help to mitigate disasters and reduce risks by discouraging high-density settlements and construction of key installations in hazard-prone areas, control of population density and expansion Mitigation Structural and non-structural measures undertaken to limit the adverse impact of natural hazards, environmental degradation and technological hazards.
Landslide	A landslide is a phenomenon in which the movement of a mass of rock, debris, or earth down a slope due to gravity. The materials may move by falling, toppling, sliding, spreading, or flowing. Since a large amount of soil mass usually moves, serious damage can occur.
Latitude	Latitude is a geographic coordinate that specifies the north–south position of a point on the Earth's surface. Latitude is an angle (defined below) which ranges from 0° at the Equator to 90° (North or South) at the poles.
Longitude	Longitude is a geographic coordinate that specifies the east-west position of a point on the Earth's surface. It is an angular measurement, usually expressed in degrees
Meander-Belt	The part of a valley bottom across which a stream shifts its channel from time to time especially in flood.
Middle Schools	Middle Schools are the schools that provide education from 5 th to 8 th grade.
Mitigation	The lessening or limitation of the adverse impacts of hazards and related disasters.
Monitoring & Evaluation (M&E)	A continuing function that uses systematic collection of data on specified indicators to provide management and the main stakeholders of an ongoing development intervention with indications of the extent of progress and achievement of objectives and progress in the use of allocated funds.
Mortality Rate	Number of deaths recorded in a population of particular region in a year.
Mouza / Deh	It is a territorial unit with a separate name, definite boundaries, and area precisely measured and divided into plots / khasras / survey numbers. Each mouza is a revenue estate and has a cadastral map maintained in the land revenue record with a Hadbast Number except Sindh Province. Mouza, Deh, Village, Killi and Chak are the names commonly used for it. The term mouza / deh is widely used in the settled areas while the term village and or killi are used in the unsettled areas. There may be one or more settlements, abadies, basties, dhokes, goths, etc. in the territory of a mouza / deh. The mouzas / dehs may also have scattered inhabitation while there may be some mouzas without population as well.
Multi Hazard Vulnerability and Risk Assessment (MHVRA)	Multi Hazard Vulnerability and Risk Assessment is a comprehensive study which intends to evaluate the expected vulnerabilities, risks and losses due to different hazardous events; both natural or man-induced.
Multi Hazards	The term Multi Hazards, as the name would suggest, are the hazards evolved from multiple sources, either inter-related or independent phenomena, and are subject to joint probability theory and analysis.

National Authority	National Authority means National Disaster Management Authority (NDMA).
Natural Disasters	Events which are caused purely by natural phenomena such as earthquakes, floods, cyclones etc.
Nullah	A Pakistani term, used for small rivers a streams carrying fresh water or sewerage disposal.
Performance Indicator	A variable that allows the verification of changes in the development intervention or shows results relative to what was planned.
Physical / Structural Vulnerability	The measure of the fragility structure, engineered or non-engineered, and its associated susceptibility to the natural stresses such as earthquake, flood etc.
Piedmont	Piedmont, in geology, landform created at the foot of a mountain or mountains by debris deposited by shifting streams.
Population Growth Rate	The growth rate is the rate at which a population is increasing (or decreasing) in a given year.
Population Projections	Population Projections are estimates of population number typically based on an estimated population consistent with most recent decennial census and are produced using cohort-component method.
Precipitation	Precipitation is the water that falls from the clouds towards the ground, especially as rain or snow.
Preparedness	Activities and measures taken in advance to ensure effective response to the impact of hazards, including the issuance of timely and effective early warnings and the temporary evacuation of people and property from threatened locations.
Prevention	Activities to ensure complete avoidance of the adverse impact of hazards.
Primary Healthcare	The primary care facilities include Basic Health Units (BHUs) and Rural Health Centers (RHCs) mainly preventive, outpatient and basic inpatient care.
Primary School	A primary school is an education facility in which children receive primary or elementary education, coming after preschool and before secondary school.
Quality Assurance	Quality assurance encompasses any activity that is concerned with assessing and improving the merit or the worth of a development intervention or its compliance with given standards. Note: examples of quality assurance activities include appraisal, RBM, reviews during implementation, evaluations, etc.
Range Lands	Range Lands are vast natural landscapes grasslands, shrub lands and wood lands.
Recovery	Decisions and actions taken after a disaster with a view to restoring or improving the pre-disaster living conditions of the stricken community, while encouraging and facilitating necessary adjustments to reduce disaster risk.
Relative Humidity	The amount of water vapour present in air expressed as a percentage of the amount needed for saturation at the same temperature.
Reliability	Consistency or dependability of data and evaluation judgments, with reference to the quality of the instruments, procedures and analyses used to collect and interpret evaluation data.
Relief / Response	The provision of assistance during or immediately after a disaster to meet the life preservation and basic subsistence needs of those people affected. It can be of an immediate, short-term, or protracted duration.
Residual Risk	The risk that remains in unmanaged form, even when effective disaster risk reduction measures are in place, and for which emergency response and recovery capacities must be maintained.
Resilience	The ability of a system, community or society exposed to hazards to resist, absorb, accommodate to and recover from the effects of a hazard in a timely and efficient manner, including through the preservation and restoration of its essential basic structures and functions.
Retrofitting	Reinforcement of existing buildings and structures to become more resistant and resilient to the forces of natural hazards.
Risk	The combination of the probability of an event and its negative consequences.
Risk Assessment	A methodology to determine the nature and extent of risk by analyzing potential hazards and evaluating existing conditions of vulnerability that together could potentially harm exposed people, property, services, livelihoods and the environment on which they depend.
Risk Management	The systematic approach and practice of managing uncertainty to minimize potential harm and loss.
Risk Transfer	The process of formally or informally shifting the financial consequences of particular risks from one party to another whereby a household, community, enterprise or state authority will obtain resources from the other party after a disaster occurs, in exchange for ongoing or compensatory social or financial benefits provided to that other party.

River	A river is a natural waterway, usually freshwater, flowing toward lower level of water surface such as a lake, a sea, or another river.
Riverine Flood	Flood is a phenomenon of inundation by water coming from a river, drainage or other water bodies, such as lakes or seas due to overflowing from ordinary boundary between land and water or water surging.
Rural Area	A rural area is an open area that has very low population and building density. Generally rural areas are away from cities/towns and its inhabitants are mostly linked with agriculture based livelihood.
Rural Health Centre (RHC)	The RHCs have 10-20 inpatients beds and each serves a catchment population of up to 100,000 people. The RHC provides promotive, preventive, curative, diagnostics and referral services along with inpatient services. The RHC also provides clinical, logistical and managerial support to the BHUs, LHWs, MCH Centers, and Dispensaries that fall within its geographical limits. RHC also provides medico-legal, basic surgical, dental and ambulance services.
Secondary Health Care	It is an intermediate level of health care that is concerned with the provision of specific technical, therapeutic or diagnostic services. It is the first referral level serving a district or a tehsil. Specialist consultation procedures and hospital admissions fall into this category of care. The role of a district hospital in primary health care has been expanded beyond being dominantly curative and rehabilitative to include promotional, preventive and educational roles as part of a primary health care approach.
Secondary School or Higher School	Secondary Schools are the schools which provide education from grade 8 till Intermediate Level, i.e. 12 th Grade or FSc.
Sedimentary Rocks	Sedimentary rocks are types of rock that are formed by the deposition and subsequent cementation of that material at the Earth's surface and within bodies of water.
Slope Failure	In this phenomenon, a slope abruptly collapses when the soil that has already been weakened by moisture in the ground loses its self-cohesiveness under the influence of rain or an earthquake. Due to sudden collapse, many people fail to escape if it occurs near a residential area, thus leading to a higher rate of fatalities.
Social Vulnerability	Characteristics of social systems that create the potential for harm or loss to it
Steppe Climate	A semi-arid climate or steppe climate is the climate of a region that receives precipitation below potential evapotranspiration, but not as low as a desert climate.
Storm Surge	A Storm Surge is phenomena of sea level rise associated with a low-pressure weather system, typically a tropical cyclone. Therefore, an early warning plan for "storm surge" should be incorporated with that of "cyclone".
Streambed	A stream bed is the channel bottom of a stream or river, the physical confine of the normal water flow
Structural / Non-Structural Measures	Structural measures refer to any physical construction to reduce or avoid possible impacts of hazards, which include engineering measures and construction of hazard-resistant and protective structures and infrastructure. Non-structural measures refer to policies, awareness, knowledge development, public commitment, and methods and operating practices, including participatory mechanisms and the provision of information, which can reduce risk and related impacts.
Sustainable Development	Development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts: the concept of "needs", in particular the essential needs of the world's poor, to which overriding priority should be given; and the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and the future needs. (Brundtland Commission, 1987)
Tehsil Head Quarter (THQ)	These hospitals are located at each THQ and serves a population of 0.5 to 1.0 million. At present majority of THQ hospitals have 40 to 60 beds. The THQ hospital provides promotive, preventive, curative, diagnostics, in patients, referral services and also specialist care. THQ hospitals are supposed to provide basic and comprehensive Emergency Obstetric and New born Care (EmONC). THQ hospital provides referral care to the patients including those referred by the Rural Health Centers, Basic Health Units, Lady Health Workers and other primary care facilities.
Tertiary Healthcare	Tertiary care hospitals are located in the major cities for more specialized inpatient care. Tertiary care is specialized consultative health care, usually for inpatients and on referral from a primary or secondary health professional.
Tsunami	A tsunami is a series of waves in a water body caused by the displacement of a large volume of water, generally in an ocean or a large lake. Earthquakes, volcanic eruptions and other underwater explosions, landslides, avalanche, meteorite impacts and other disturbances above or below water all have the potential to generate a tsunami.
Unemployment	The "unemployed" comprises all the persons ten years of age and above who during the reference period were without work, currently available for work and are seeking work.
Urban Area	An Urban area is human settlement with high population density and infrastructure of built environment. Urban areas are created through urbanization and are categorized by urban morphology as cities, towns, conurbations and suburbs.
Urban Flood	Flood and inundation phenomena occurring in the city or built-up areas.

Veterinary Facility

It refers to the availability of veterinary facilities for livestock with qualified veterinarian (Doctor / Assistant) for provision of medical facilities for farm animals.

Vulnerability

The characteristics and circumstances of a community, system or asset that make it susceptible to the damaging effects of a hazard.

Wet Areas

Areas which are naturally covered with fresh or saline water such as river and lakes are grouped in this class.

Wheat Procurement Centre

These centres are established every year at the time of wheat harvest in surplus wheat producing areas particularly of the Punjab and Sindh provinces by the Provincial Food Departments and or Pakistan Agricultural Services and Storage Corporation (PASSCO) at appropriate locations. These centres are not permanent in nature and their number in a tehsil / district varies on year to year basis depending upon the procurement policy.

LIST OF ACRONYMS

AMS	Assistant Medical Superintendent	MOVERE	Mobilization of Volunteer for Emergency Response Exercise
APWMO	Assistant Principal Women Medical Officer	MPE	Most Probable Earthquake
AWO	Automatic Weather Observation	MS	Medical Superintendent
AWS	Automatic Weather Station	MSSP	Micro Seismic Study Program (Pakistan Atomic Energy Commission)
C&W	Communication & Works	MM	Moment Magnitude
CBDRM	Community Based Disaster Risk Management	NARC	National Agricultural Research Center
CBEWS	Community-Based Early Warning System	NCEG	National Center of Excellence in Geology
CMO	Casualty Medical Officer	NDI	NOAA Drought Index
CRI	Composite Risk Index	NDMA	National Disaster Management Authority
DC	Deputy Commissioner	NDMC	National Disaster Management Commission
DCO	District Coordination Officer	NDMP	National Disaster Management Plan
DDMA	District Disaster Management Authority	NDMP-SC	Steering Committee for National Disaster Management Plan
DDRMP	District Disaster Risk Management Plan	NDRIS	National Disaster Risk Information System
DEWS	Disease Early Warning System	NDVI	Normalized Difference Vegetation Index
DHQ	District Headquarter Hospital	NDWI	Normalized Difference Water Index
DM	Disaster Management	NEOC	National Emergency Operations Centre
DMS	Deputy Medical Superintendent	NFPP	National Flood Protection Plan
DRR	Disaster Risk Reduction	NHA	National Highway Authority
DSHA	Deterministic Seismic Hazard Assessment	NHEPRN	National Health Emergency Preparedness and Response Network
ENT	Ear, Nose, Throat	NIDM	National Institute of Disaster Management
EPI	Expanded Program on Immunization	PARC	Pakistan Agricultural Research Council
EWS	Early Warning System	PASSCO	Pakistan Agricultural Services and Storage Corporation
PDMA	Provincial Disaster Management Authority	PBC	Pakistan Broadcasting Corporation
FFC	Federal Flood Commission	PBS	Pakistan Bureau of Statistics
FGD	Focus Group Discussion	PCIW	Pakistan Commissioner for Indus Waters
GIS	Geographic Information System	PCRWR	Pakistan Center for Research on Water Resources
GLOF	Glacial Lake Outburst Flood	PDMA	Provincial Disaster Management Authority
GMPE	Ground Motion Prediction Equation	PDSI	Palmer Drought Severity Index
GOERE	Government Officer Emergency Response Exercise	PGA	Peak Ground Acceleration
GPS	Global Positioning System	PHDI	Palmer Hydrological Drought Severity Index
GSP	Geological Survey of Pakistan	PIPD	Provincial Irrigation and Power Department
HFA	Hyogo Framework for Action	PMD	Pakistan Meteorological Department
HTC	Hydro-Thermal Coefficient	PMO	Principal Medical Officer
INGOs	International Non-governmental Organizations	PMU	Project Management Unit
LSWI	Land Surface Water Index	PRA	Participatory Risk Assessment
M&E	Monitoring and Evaluation	PSC	Project Steering Committee
MBT	Main Boundary Thrust	PSHA	Probabilistic Seismic Hazard Assessment
MCE	Maximum Considered Earthquake	PTA	Pakistan Telecommunication Authority
MGDs	Millennium Development Goals	PTCL	Pakistan Telecommunication Company Limited
MHVRA	Multi Hazard Vulnerability and Risk Assessment	PTWC	Pacific Tsunami Warning Center
MKT	Main Karakorum Thrust	PWMO	Principal Women Medical Officer
MMT	Main Mantle Thrust		
MO	Medical Officer		

R&D	Research and Development	TMA	Tehsil Municipal Administration
RDMC	Regional Drought Monitoring Centre	UC	Union Council
RP	Return Period	UN	United Nations
SFDRR	Sendai Framework for Disaster Risk Reduction	VCI	Vegetation Condition Index
SMA	Soil Moisture Anomaly	VegDRI	Vegetation Drought Response Index
SMDI	Soil Moisture Deficit Index	VIC	Variable Infiltration Capacity
SMO	Senior Medical Officer	WAPDA	Water and Power Development Authority
SMRFC	Specialized Medium Range Forecasting Centre	WASA	Water and Sanitation Agency
SOP	Survey of Pakistan	WFP	World Food Program
SoVI	Social Vulnerability Index	WHO	World Health Organization
SPEI	Standardized Precipitation Evapotranspiration	WMO	World Meteorological Organization
SPI	Standard Precipitation Index	WMO	Women Medical Officer
SPI	Stream Power Index	WOE	Weight of Evidence (Statistical Model)
SPT	Standard Penetration Test	WRF	Weather Research and Forecast (Name of Numerical Calculation Model)
SRSI	Standardized Reservoir Supply Index		
SSFI	Standardized Stream Flow Index		
SSI	Semi Structured Interviews		
SUPARCO	Pakistan Space and Upper Atmospheric Research Commission		
SWI	Standardized Water-Level Index		
SWMO	Senior Women Medical Officer		
SWS	Soil Water Storage		
SWSI	Surface Water Severity Index		
SWSI	Surface Water Supply Index		
TCI	Temperature Condition Index

A

BASELINE
INFORMATION

Multan is one of the most versatile districts of Pakistan having rich history, art, architecture, archeology, architecture, literature and culture. The District is situated along the banks of Chenab River and lies more or less at the geographic center of the Country. Its neighboring districts include Khanewal, Vehari, Lodhran and Muzaffargarh. The District covers geographical area of about 3647 km² and has total population of 4.8 Million (2017 Census). It is composed of four tehsils namely Jalalpur Pirwala, Multan City, Multan Saddar, Shujabad and has total of 86 Union Councils and 532 Mouzas. The district is a commercial and financial hub of South Punjab with a versatile economic base ranging from cultural artifacts to modern day industry. Many fruits and vegetables are grown in the district with Mangoes known to be among the best and sweetest varieties produced globally.

i. Pre-Arabs Period (Up to 700 A.D)

The history of Multan in this period is little known. But there is evidence to suggest that the District originated thousands of years back in the past. It is nearly certain that Alexander passed through this area sometimes during B.C 325- 326. Early history by Arab Geographers indicates that Multan has also been capital of Sindh province, and was then ruled by Chach who remained in power till his death in A.D. 671.

II. Arab Rule (700-970 A.D)

The Arabs in 712 A.D defeated Raja Dahir and marched on towards Multan under the leadership of Muhammad Bin Qasim who paved the way for subsequent conquest of India. As the time passed on, the power of Caliphate began to weaken and by the end of the 9th century Multan was for all practical purposes independent of Baghdad.

III. Karmatians Period (970-1206 A.D.)

After their success in Syria, Basra, and Kufa, the Karmatians appeared gradually to have pushed themselves with their doctrine into the Indus Valley. At that time, Raja of the native Sumra family enjoyed full power backed by Karmatians. After remaining in their hands till two centuries, the Multan was ultimately delivered to Mahmood Ghori who in the course of his expeditions passed several times through Multan.

IV. Mughal Invasion (1206 - 1526 A.D)

In 1218 Chingiz invaded Western Turkestan and for next three hundred years the history of Multan remained under the rule of Mughal dynasty.

V. The Mughal Rule (1528-1752 A.D)

Multan enjoyed a long period of peace and entitled as 'Dar-ul-aman' during the strong centralized Mughal rule. For at least two hundred years from 1548 to 1748 there was no warfare in this part of Punjab. The cultivation remained for the most part confined to the riverain lands. The area immediately around and north of Multan was available for settlers in Shah Jehans reign and was colonized by men from all parts of North Western-India. Commerce seems to have flourished and Multan itself became a noted emporium for trade between Hindustan and Persian Empire.

VI. Pathan and Sikh Rule (1752-1843)

In 1752 Multan became a province and the loyalties of this province were with Afghan Kings of Kabul. The region was ruled for the most part by Governor of Pathan extraction under the rule of Soddazai family. In 1818 Raja Ranjit Singh stormed the Multan fort and took over Multan. In 1821 Diwan Sawan Mal was made the Governor of Multan and for next 13 years this area remained under the rule of Sawan Mal.

VII. Multan During British Rule (1845-1947)

By December 1848, the British had captured portions of Multan's outskirts, and destroyed the Multan Fort leading to the surrender of Mulraj and his forces to the British. The British conquest of the Sikh Empire was completed in February 1849, after the British victory at the Battle of Gujrat. Between the 1890s and 1920s, the British laid a vast network of canals in the Multan region, and throughout much of central and southern Punjab province.

Front view of old colonial building in British Raj.

Culture

The culture of Multan has some prominent elements that form its identity. Those elements include:

I. Traditional Dresses

Multan is famous for its multani dresses, mainly for women. The dresses are made with beautiful embroidery and have a very ethnic touch to them. The dress for men includes shalwar kamiz and lungi. Another element in its dress code includes the Multani Khussas: shoes that are the latest trends in streets of Pakistan. Nowadays, these khussas are in fashion and are demanded by women all over Pakistan. This demand has risen the price of this product and has made it slightly expensive than other regular khussas available in the market.

II. Food

The District produces one of the best mangoes in the world. There are many varieties of mangoes being produced and mango farms are undoubtedly the most common sight in the suburbs of Multan. Chaunsa, Langra, Anwar ratol, Dusairi, Fajri, Desi and Sindhri are some of the many mango varieties currently being cultivated in Multan. Sohan Halwa (sweets) is another specialty of Multan and is popular throughout the Country. The district is also famous for the cultivation of wheat, cotton, rice and sugar cane as well as other fruits apart from mangoes such as citrus, guavas and pomegranates.

III. Multani Mitti

Multani sand is used as Clay for beauty mask for absorbing moisture. It is available in most of the cosmetics shops. It is demanded all over the country by different parlors' and skin care institutions.

IV. Language

Punjabi & Saraiki are the widely spoken local languages within the district while English and Urdu are the official languages being used in offices and educational institutions.

Traditional Crafts

- ✓ Mausoleum of Hazrat Bahu -ud- din Zakriya
- ✓ Mausoleum of Shah Shams Sabzwari
- ✓ Mausoleum of Shah Rukn-e-Alam
- ✓ Qila Kohna
- ✓ Qasim Bagh Stadium
- ✓ Ruins of Parhaland Temple in Fort Kohna Multan
- ✓ Ahmad Shah Abdali's Birthplace Monument
- ✓ Pak Gate
- ✓ Multan Fort
- ✓ Multan Museum
- ✓ Delhi Gate Multan
- ✓ International Cricket Stadium Multan
- ✓ Ghanta Ghar Multan

2 GEOLOGY

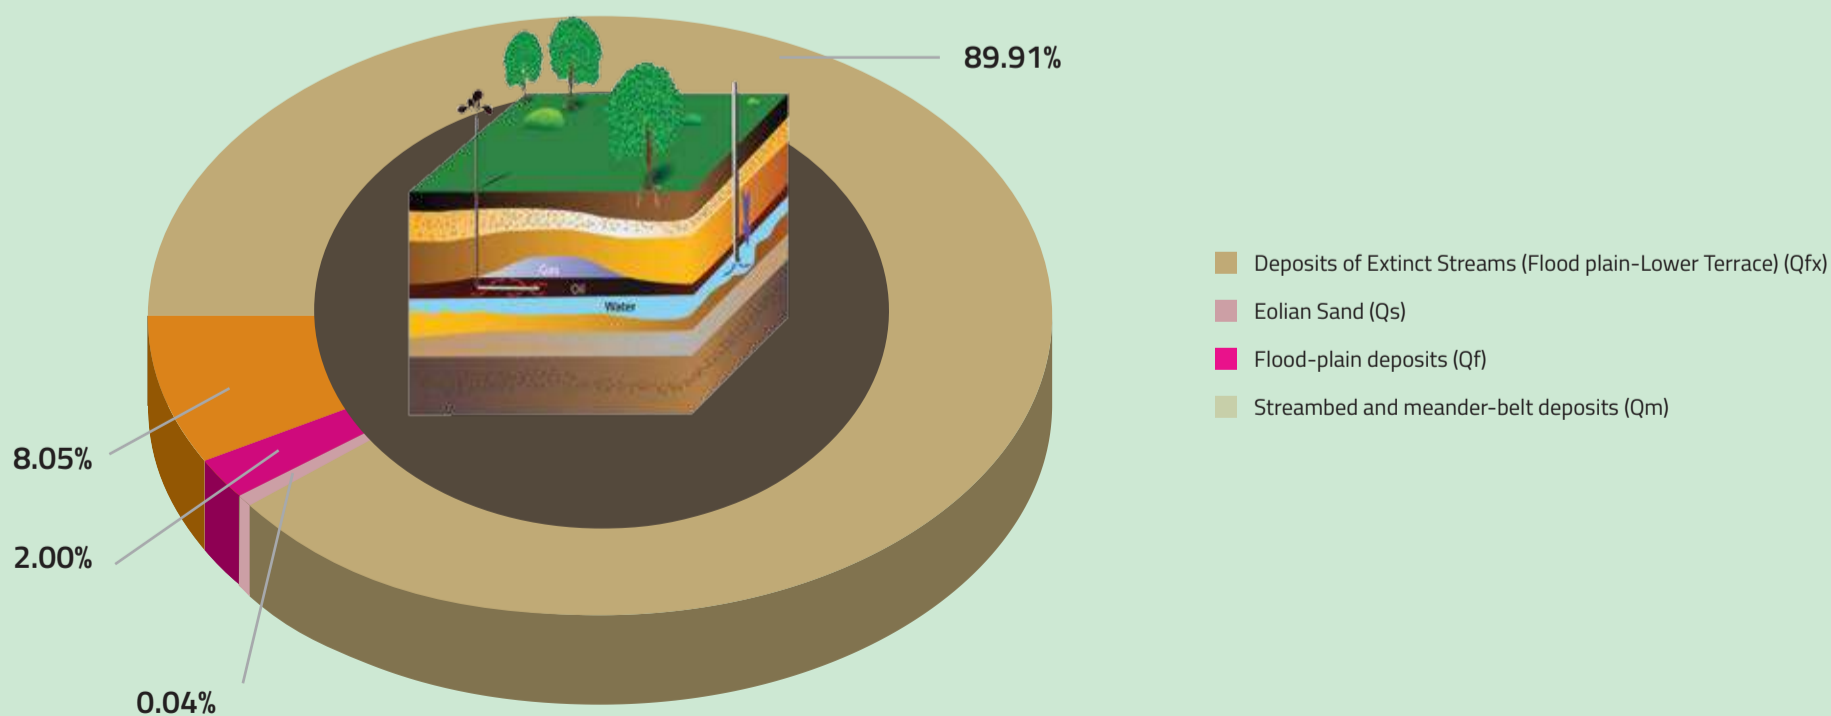

The surface geology of Multan is mainly consists of fluvial deposits which includes 89.9% of flood plain deposits of extinct streams whereas the remaining 10% comprise of present flood plain and river bed deposits with little amount of eolian deposits. The geological diversity of Multan can be seen through Table 1.

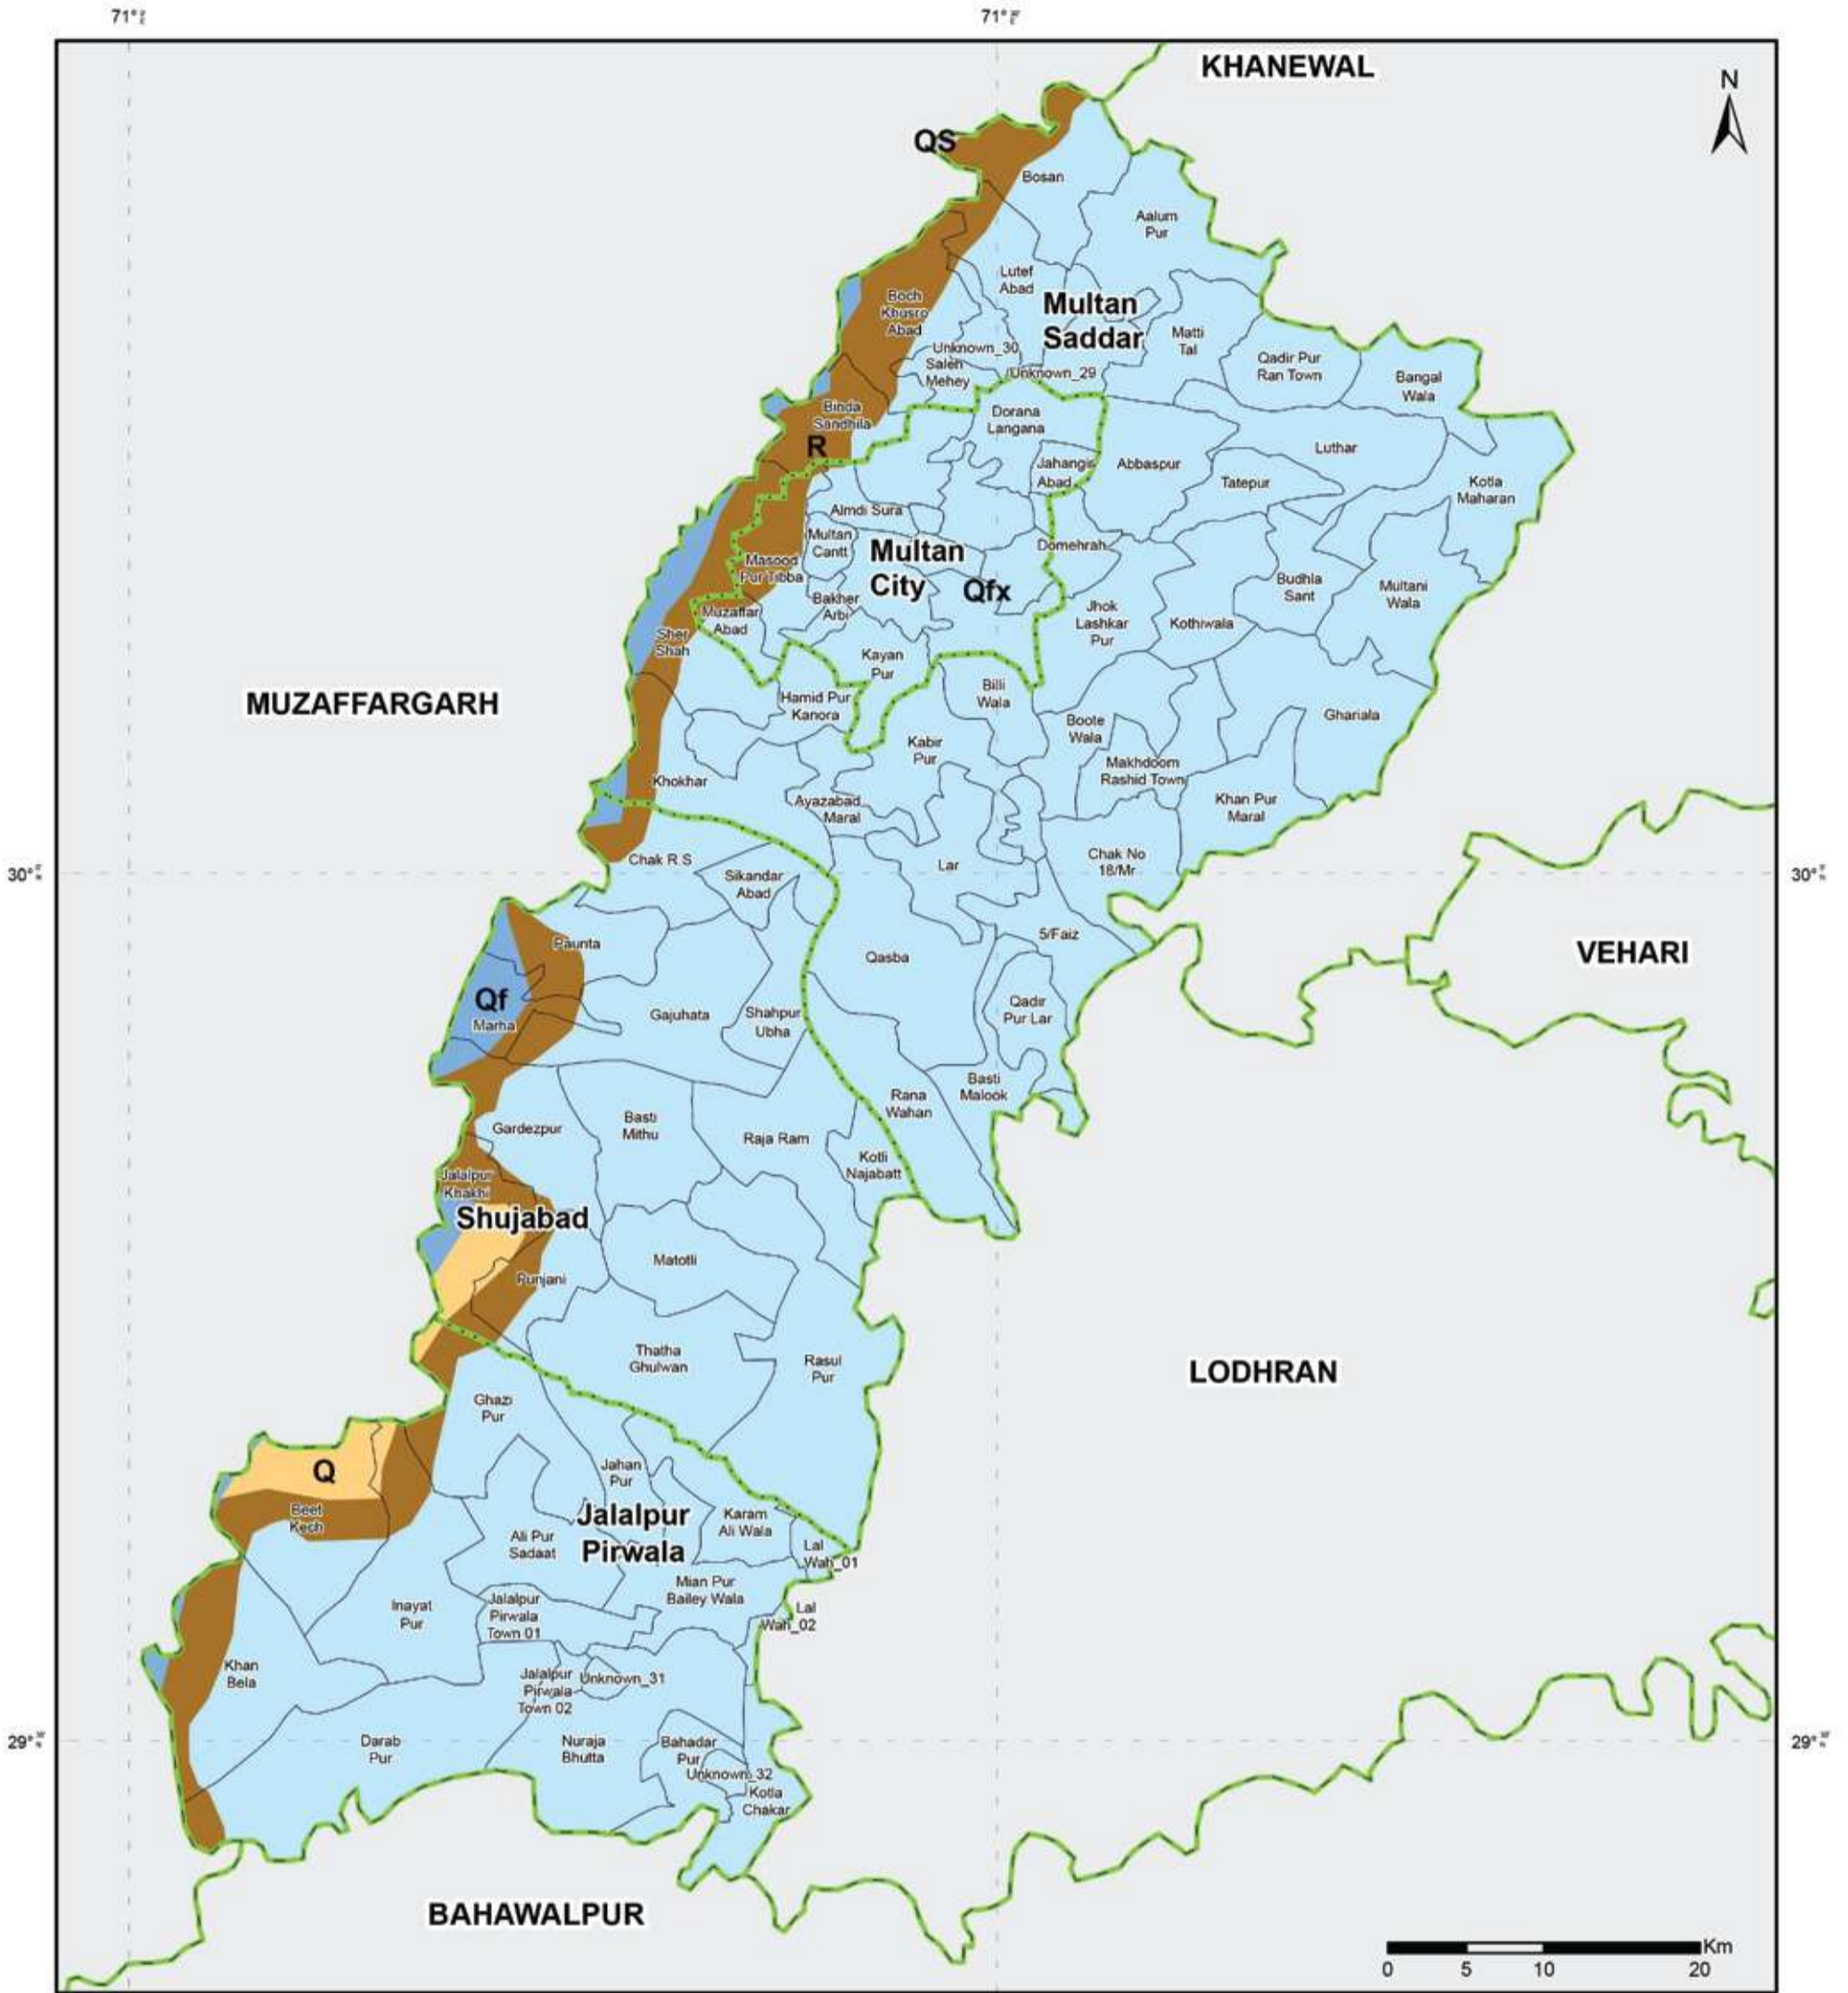

The Multan district lies in the Central Indus Platform Basin, also known as Punjab Platform. Geologically, Sargodha High lies in the north, Mari-Kandhkot High in the south whereas Sulaiman depression and fold belt in the west of Punjab Platform extending in the east toward Bikaner-Nagaur Basin of India. Punjab Platform is considered as a westerly dipping monocline toward the Sulaiman depression. Outcrops of sedimentary rocks are not exposed on surface throughout the platform region and mostly covered with alluvium and other recent fluvial deposits.

Geological Formation	Area (sq.km)	Composition
Deposits of Extinct Streams (Flood plain-Lower Terrace) (Qfx)	3189.5	89.91 %
Eolian Sand (Qs)	1.29	0.04 %
Flood-plain deposits (Qf)	70.96	2.00 %
Streambed and meander-belt deposits (Qm)	285.6	8.05 %

Land Cover (LC) is defined as the observed (bio) physical cover on the earth's surface, whereas Land Use (LU) is characterized by the arrangements, activities and inputs that people undertake in a certain land cover type in order to produce, change or maintain it. Knowledge of the LU/LC distribution helps Land Use Planners and Policy Makers to determine pragmatic and educated land use policies.

Land Cover/ Land Use (LULC) processes are important to be monitored since they are the direct drivers of Climate & Ecosystem Change. For this study, LU/LC demarcation carried out by Space & Upper Atmosphere Research Commission (SUPARCO) has been used which provides a comprehensive description of the biotic and abiotic resources of the study area and includes, inter alia, numerous categories of cultivated land; natural vegetation and non-vegetated areas including bare and

rocky areas, and areas of human settlement. In this study, Land Cover Classification System (LCCS) approach has been used with an aim to capture the physiographic characteristics down to a UC level.

The geospatial database, prepared by SUPARCO, is used to provide basis for the development of an improved capacity for natural resources monitoring and management.

The legend consisting 13 main land cover classes have been used in this study which are being further subdivided into 36 classes, and have been mapped based on the analysis, interpretation and validation of SPOT -5 very high resolution satellite imagery. For this purpose, satellite images were segmented into homogeneous polygons and labeled using the LCCS classification system.

Elevation is the measurement of height of the land with respect to sea level or the sea floor. Elevation maps are used to identify how flat, elevated or hilly an area is, as well as to analyze other features of land using contour lines and symbols.

District Multan is relatively flat as geologically it is underlain by a gently sloping monocline toward the Sulaiman ranges in the west.

The elevation of the district is between 156m (High) to 79m (Low). It can be analyzed from the map that around 2150 Km² (59%) of the district lies within elevation range of 111-125m. The average height of district is 116.92m, whereas the mean, maximum and minimum heights of the tehsils are shown in figure 9.

Elevation Distribution of District Multan

5 POPULATION DISTRIBUTION

As per the 1998 Census, the total population of district Multan was 3,116,851 with an annual growth rate of 2.73%. The total urban population was 1,314,748 and rural population of 1,802,103. For this

study, projected population of 5,107,859 as of 2015 is used on inter census growth rate of 1981 and 1998.

The average population density of Multan district was nearly 837.9 persons per sq.km as per 1998 which in 2015 has grown to 1400.5 persons per sq.km. The most densely populated Tehsil of the district is Multan City whereas Jalalpur Pirwala is the sparsely populated. Multan City Urban is the most densely populated union council of the District with density of 661463 persons/ sq. km.

7 SETTLEMENTS

The settlements of the district include tehsils, union councils, cities and villages. We can broadly classify the settlement of Multan district in to two forms i-e Urban Settlement and the Rural Settlement. The geographic distribution of settlements over the district is manifested in the Settlement Map.

Land Use Pattern (1981 & 2014)

11 TELECOMMUNICATION

Communication System; particularly telecommunication services, plays a role of significant importance in connecting distant people either through wired or wireless voice services. These telecommunication technologies have been changed immensely in the last twenty years. Before the emergence of cellular systems, the communication system of District Multan was primarily based on telephone services, known as Public Service Telephone Systems (PSTNS). However, with worldwide expansion/growth and recognition of wireless communication systems, cellular systems have also been deployed in the district.

There are 28 telephone exchanges operating in the district, ranging in capacities from 50 lines to 34,000 lines. Cellular phone services are available in the district.

The Cellular Service Providers in the districts include Mobilink, Telenor, Ufone, Warid and Zong. The map on right, identifies total number of telecommunication towers distributed over the different parts of the district.

Multan district has a plain surface made of alluvial soil sloping gently from North-East to South-West with a slight slope from North-West to South-East as well. This formation is recent, shaped by the ever changing course of River Chenab and River Ravi. River Ravi has changed multiple courses in past. Various canals from River Sutlej and River Chenab pass through Multan and its adjoining districts making the area fertile and very ideal for agriculture.

Major crops produced in the area include Cotton, Wheat and Sugarcane while crops grown in minor quantities include Rice, Maize, Jawar, Bajra, Moong, Tobacco, Masoor, Mash and oil seed such as Mustard/Rape and

Sun Flower.

Mangoes of Multan are known to be among the best and sweetest varieties of mangoes produced globally. A large portion of mango cultivation is exported to different countries including Japan, Canada, England and Saudi Arabia. Besides Mangoes, Guava, Citrus, Pomegranate are also grown in major quantities while Dates, Banana, Phalsa, Jaman, and Pears are grown in minor quantities. In vegetables, Onion, Potatoes, Cauliflower, Carrot are majorly grown. Peas, Ladyfinger, Turnip, Bottle Gourd, Garlic, Chilies and Tomatoes are also grown in the district in minor quantities.

Multan District bears an extreme climate, being hot in summer and cold in winter. The temperature ranges generally from 28-43°C in summer and 5-29°C in winter. June is the hottest month with maximum temperature reaches at 42.2 °C while January is the coolest month where minimum temperature is around 6°C. Average maximum precipitation is in the range of 40-50mm and received during the months of July and August while the driest months are October and November. The total annual rainfall in the district is around 175mm.

HAZARD ASSESSMENT

- DROUGHT
- EARTHQUAKE
- FLOOD

2 DROUGHT HAZARD ASSESSMENT

A large part of Pakistan faces severe effects of drought for most part of the year. Long-drawn-out presence of drought is a significant challenge to agriculture, human lives, livestock, forests, water resource management, urban planning and food security. Due to changing climatic patterns, the drought phenomenon is likely to increase in terms of recurrence, extent, and intensity, for which drought hazard assessment can provide scientific basis for planning interventions for DRR and land use planning. In this study following indices are used for assessment of drought hazard for District Jhang to a Union Council level.

- a. Standard Precipitation Index (SPI)
- b. Normalized Difference Vegetation Index (NDVI)
- c. Drought Severity Index (DSI)
- d. Temperature Condition Index (TCI)
- e. Vegetation Condition Index (VCI)
- f. Vegetation Health Index (VHI)

Drought return period

A return period is the recurrence interval of a drought. It is statistical measurements, particularly based on previous data. Strategic planning and management of water resources under climate change and drought conditions often require the assessment of return periods of drought events categorized by high severities. Based on above mentioned 12-SPI, drought return period of 1951-2015 for district Jhang is mentioned below.

Drought Occurrence (Years)	Most Severe Drought
1984, 1985, 1987, 1988, 1991, 1998, 2000, 2002, 2003, 2009	2000

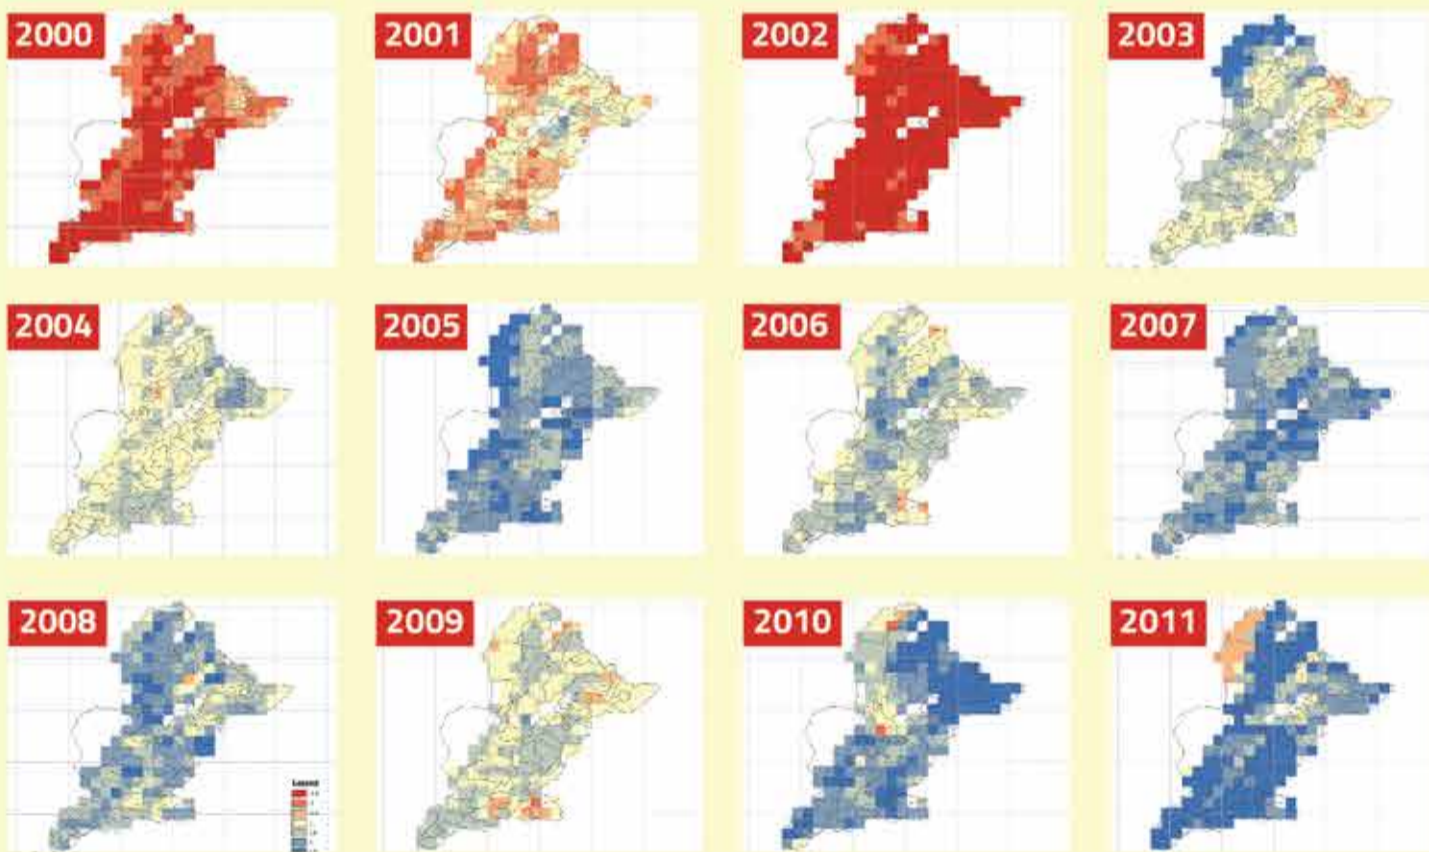

Standard Precipitation Index (SPI) 1981-2014

SPI Value	Conditions
2.0+	Extremely Wet
1.5 to 1.99	Very Wet
1.0 to 1.49	Moderately Wet
-0.99 to 0.99	Near Normal
-1.0 to -1.49	Moderately Dry
-1.5 to -1.99	Severely Dry
-2.0 and less	Extremely Dry

Description: SPI is a tool to determine the severity of a drought at a given time scale (temporal resolution) of interest for any rainfall station with historic data (record of at least 30 years). Mathematically, the SPI is based on the cumulative probability of a given rainfall event occurring at a station.

Drought Severity Index (DSI) 2000-2011

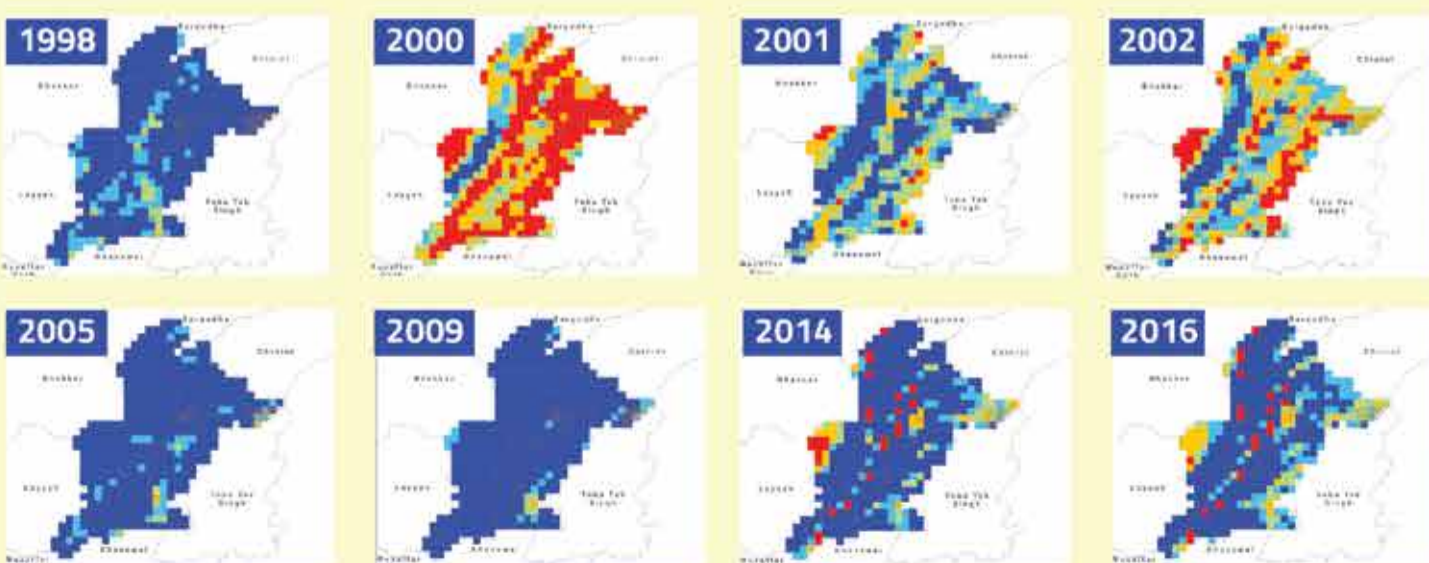

Legend:

- -1.5
- -0.5
- 0.5
- 1.5
- -1
- 0
- 1

Description:

DSI is an effective tool to estimate relative dryness of the land through using available temperature and precipitation data. It spans between the scales of -10 (dry) to +10 (wet).

Vegetation Condition Index (VCI) 1998-2016

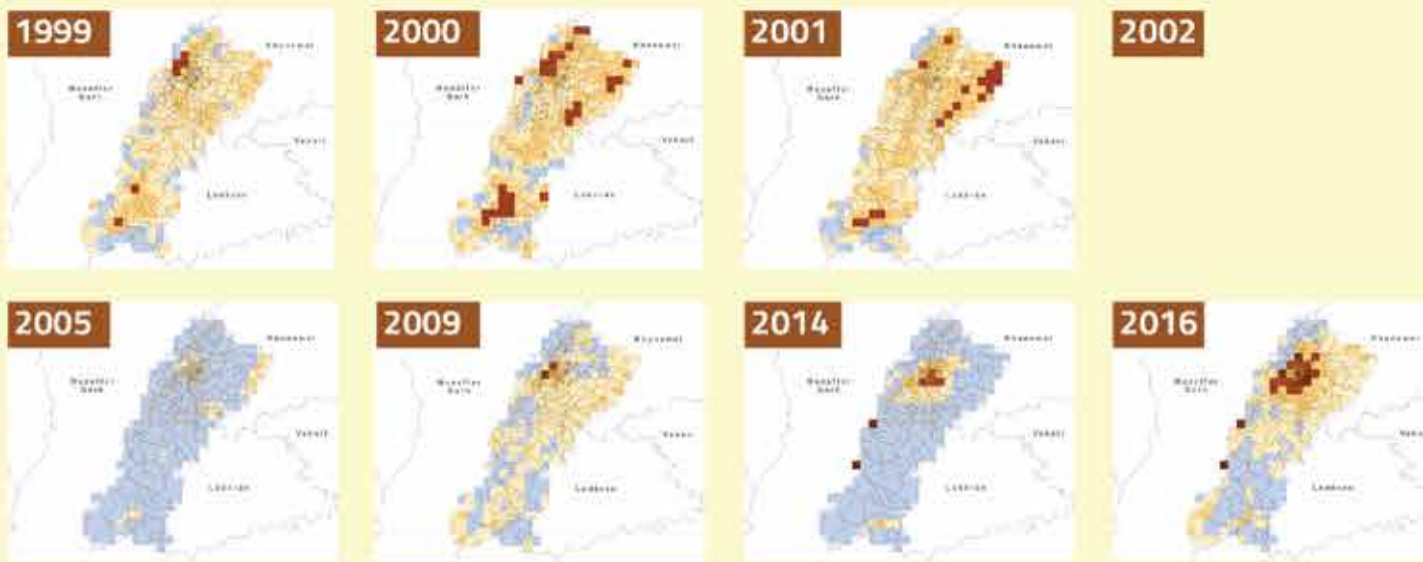

Legend:

- <10 (Extreme Drought)
- <20 (Severe Drought)
- <30 (Moderate Drought)
- <10 (Mild Drought)
- <10 (No Drought)

Description:

VCI is used to identify drought situations and determine the onset, especially in areas where drought episodes are localized and ill defined.

Vegetation Health Index (VHI) 1999-2016

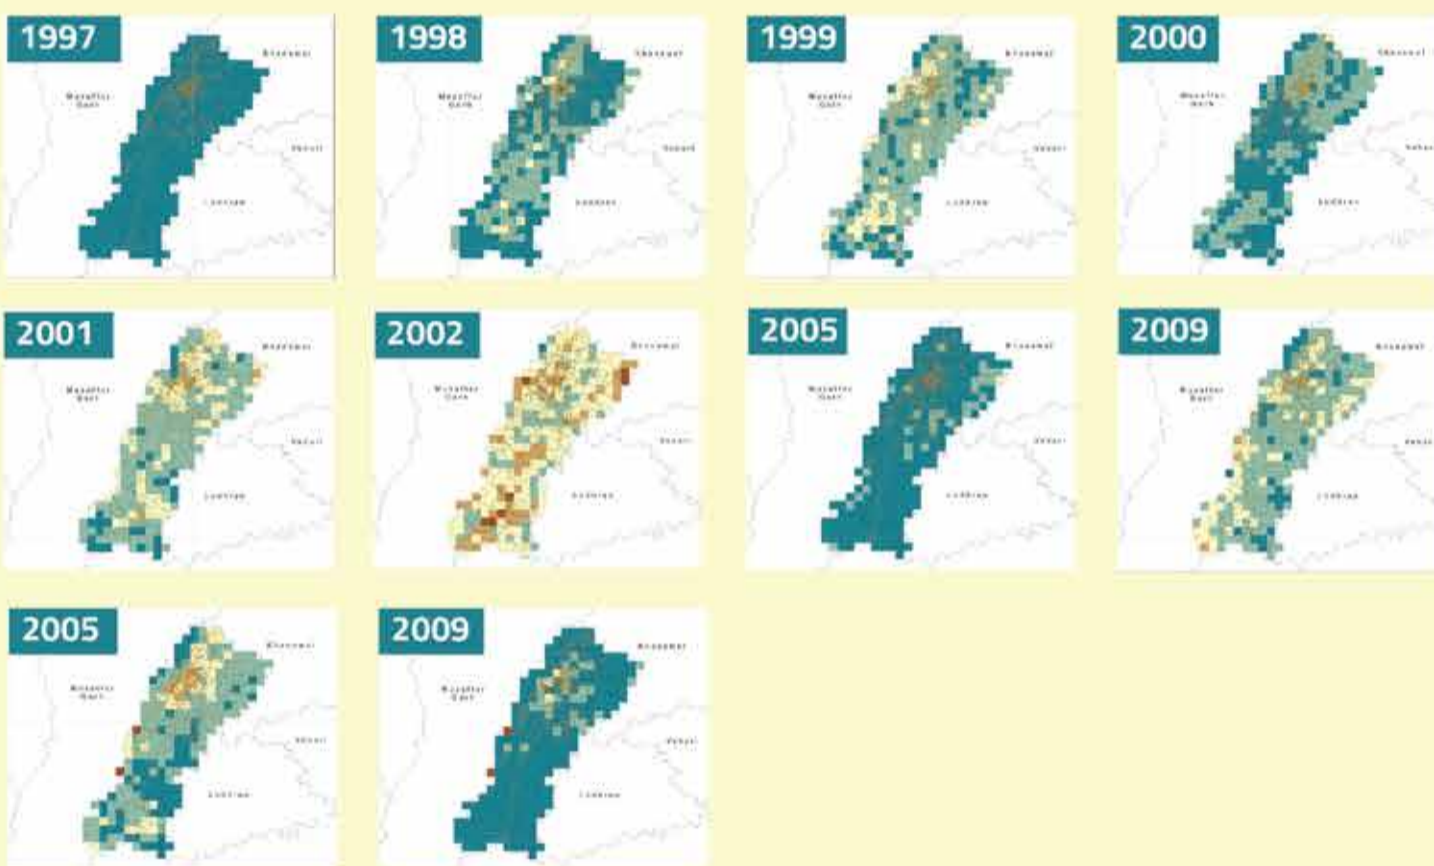

Legend:

- <10 (Extreme Drought)
- <20 (Severe Drought)
- <30 (Moderate Drought)
- <10 (Mild Drought)
- <10 (No Drought)

Description:

VHI is used to identify and classify stress to vegetation due to drought.

Temperature Condition Index (TCI) 1997-2016

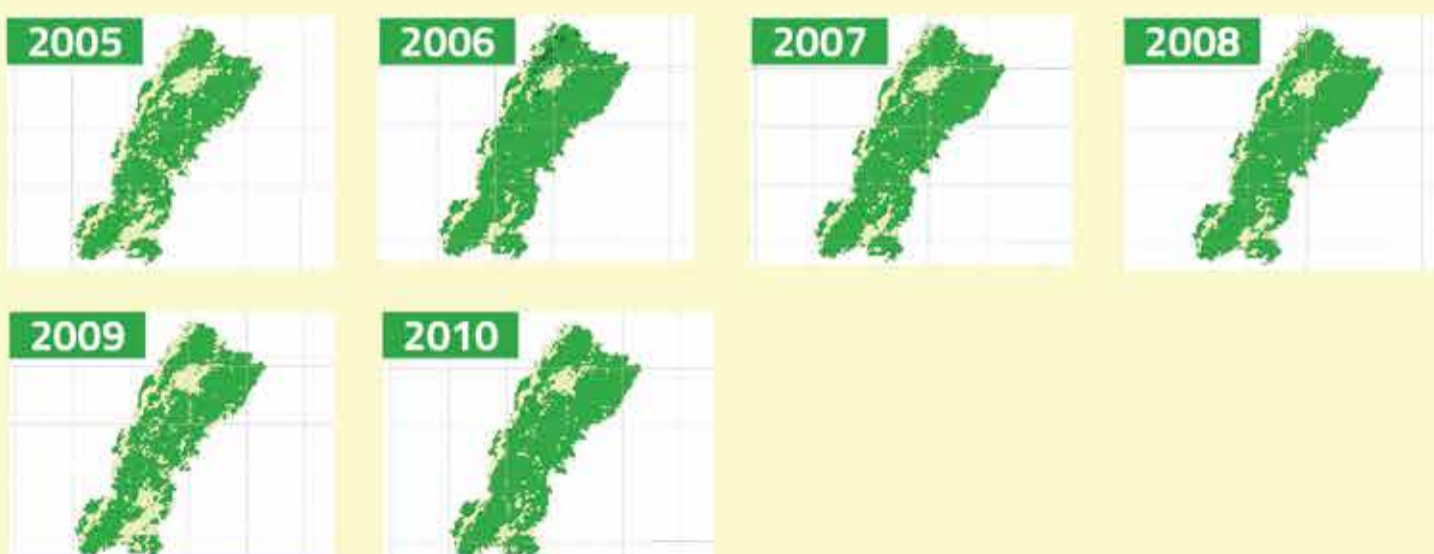

Legend:

- <10 (Extreme Drought)
- <20 (Severe Drought)
- <30 (Moderate Drought)
- <10 (Mild Drought)
- <10 (No Drought)

Description:

TCI is used to determine stress on vegetation caused by high temperatures and dryness.

Normalized Difference Vegetation Index (NDVI)

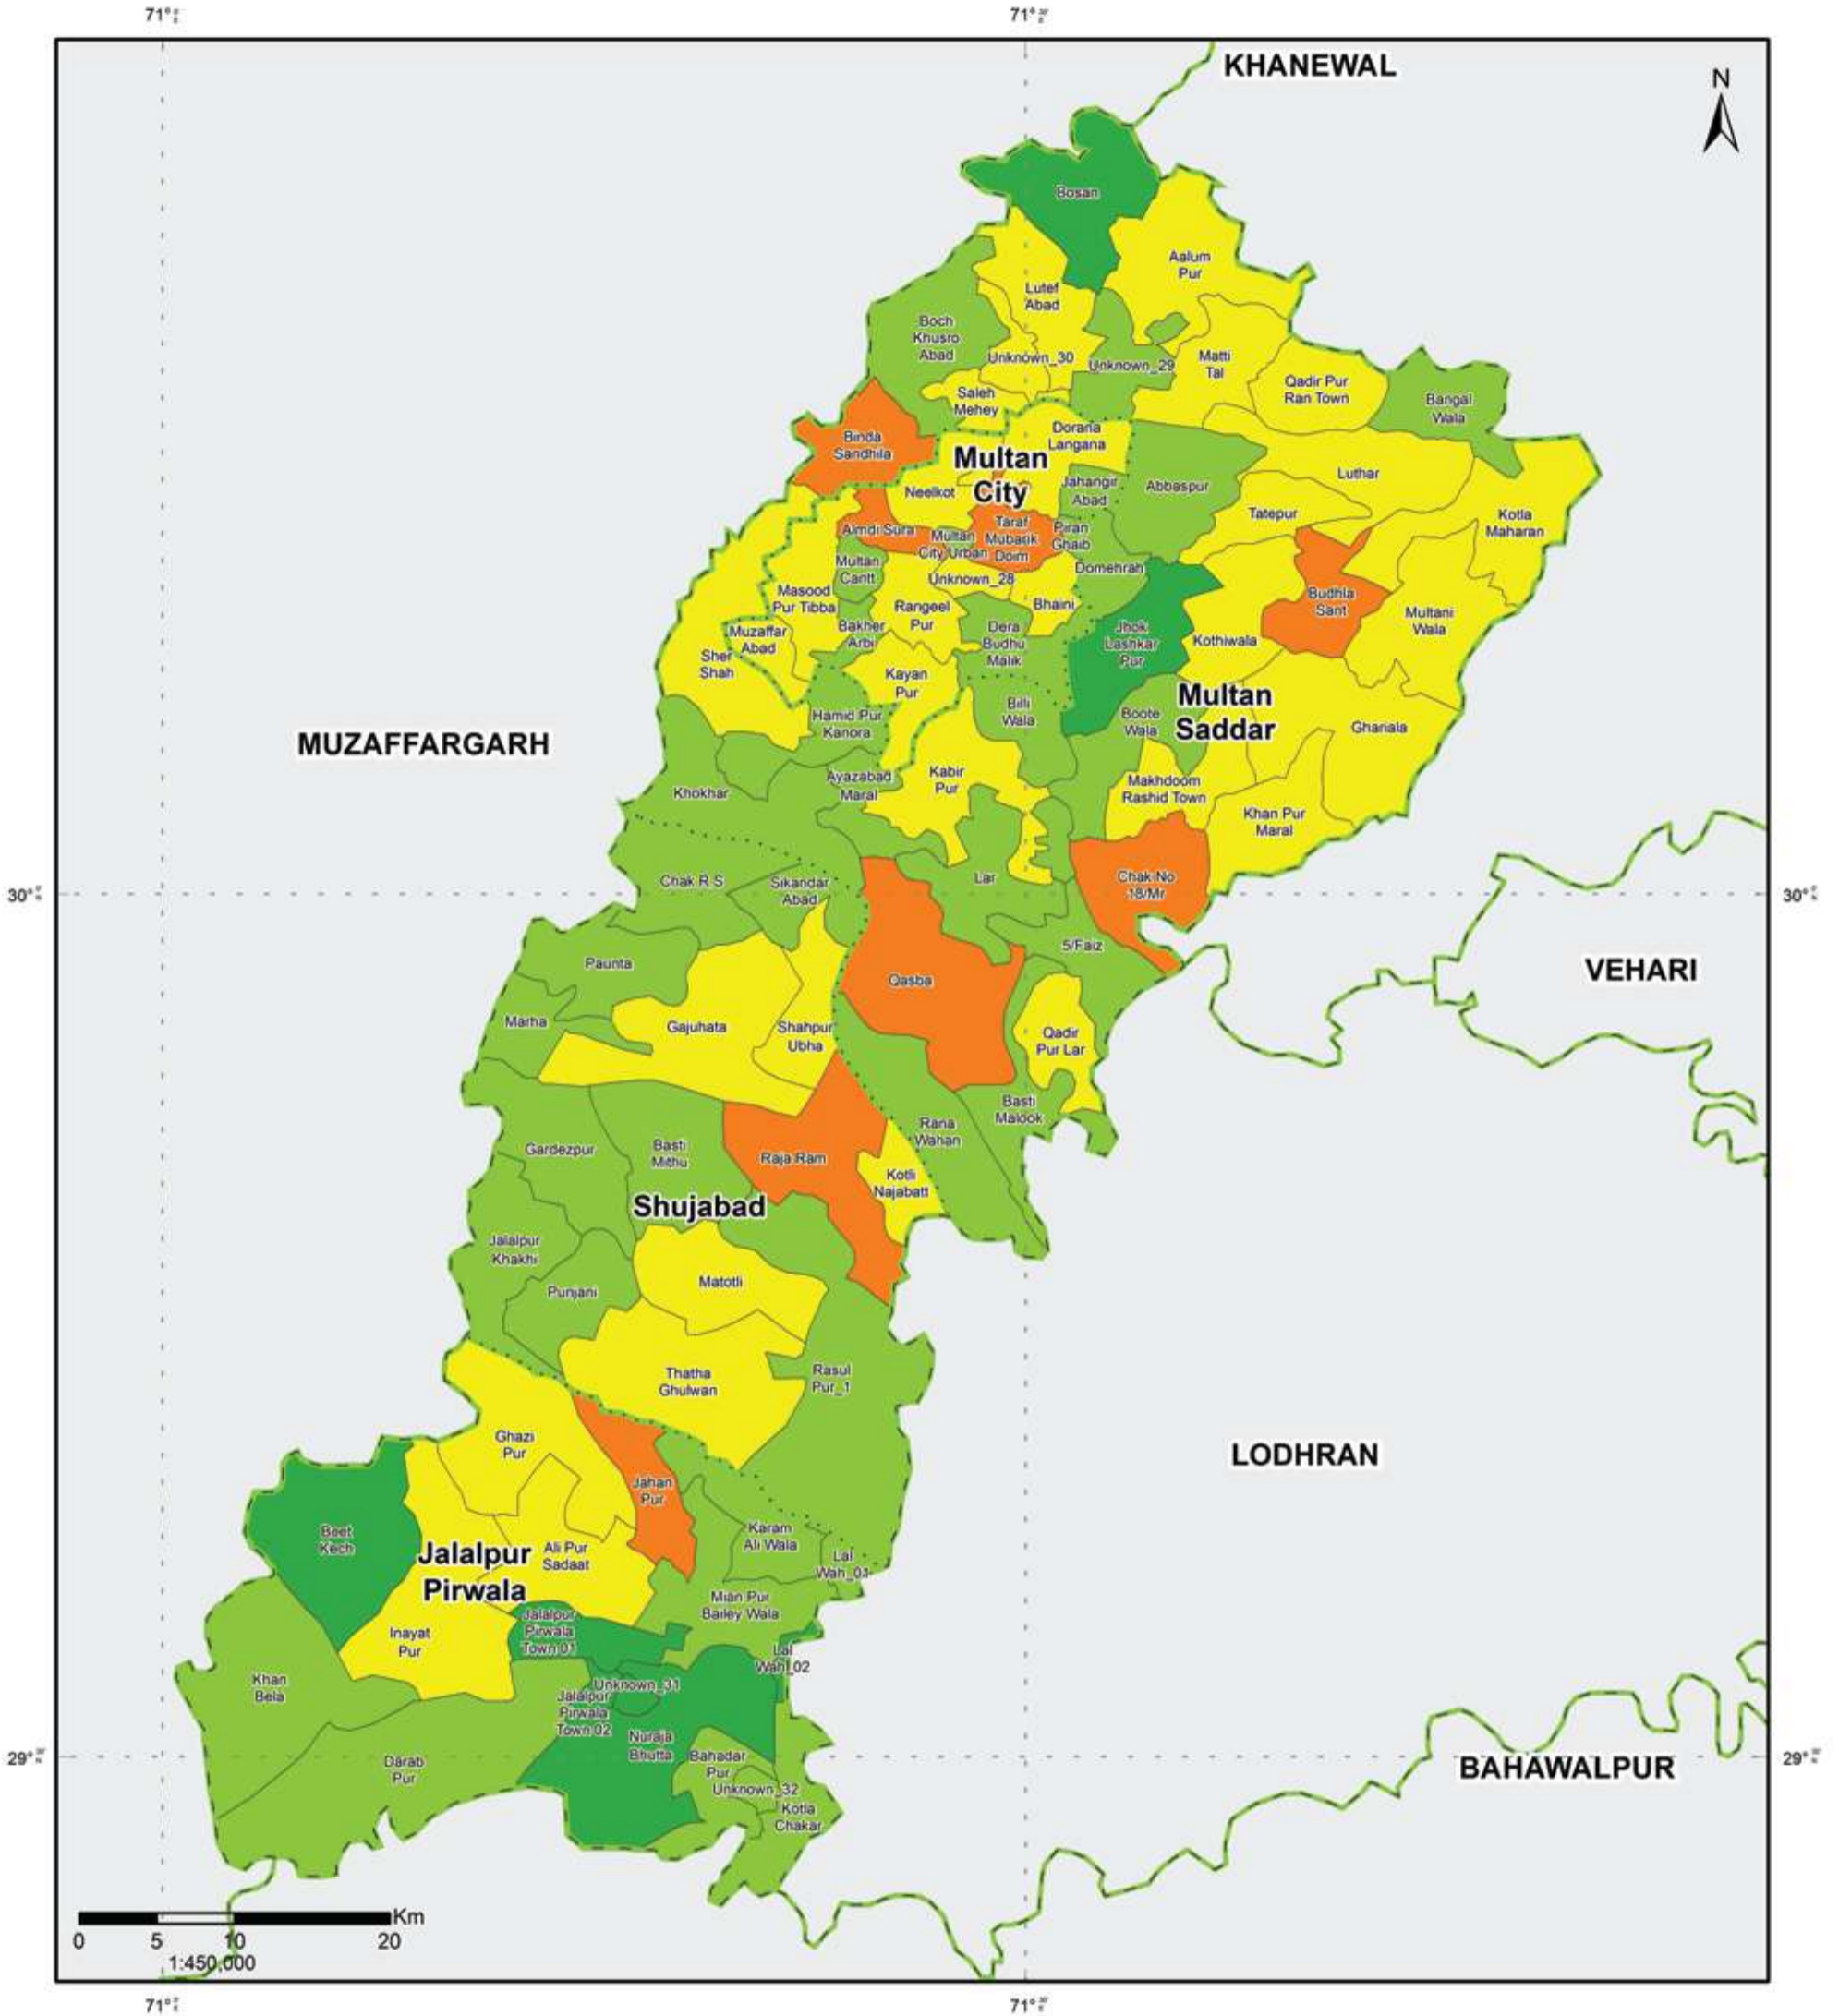

Legend:

- -0.3-0
- 0.01-0.1
- 0.11-0.3
- 0.31-0.6
- 0.61-0.9

Description:

The NDVI utilizes satellite imagery to evaluate variations in the normalized difference between the reflectance in near infrared (NIR) and visible red bands, which are responsive to changes in vegetation. Higher NDVI values reflect healthy vegetation, whereas lower NDVI values depict stress condition.

Earthquake is defined as shaking and vibration at the surface of the earth resulting from underground movement along a fault plan from volcanic activity, cryoseismic activity, the sudden cracking of frozen soil or rock or due to movement of plate boundaries of the Earth. Earthquakes hazard at a site is characterized by either probabilistic or deterministic seismic hazard analysis. Probabilistic seismic hazard analysis involves the quantification of rate of probability of exceedance taking into consideration all possible earthquakes. Deterministic analysis evaluates the site specific seismic hazard that is influenced by maximum hazard from controlling sources. The general Probabilistic seismic hazard analysis procedure involves quantifying the annualized rate of exceedance of specified ground motions of various intensities, which is transformed to obtain the probability of exceedance of ground motions within the lifetime of the structure and infrastructure of interests. District Multan has no major fault line passing through it. According to the historical catalogues used in this assessment, area is not highly active in terms of seismic motion. The main findings of the probabilistic seismic hazard assessment were that the ground motions in District Multan lies in low seismic activity zones. The following table shows the PGA based values against each settlement type in District Multan. Some of the most important historical seismic events in the region are shown below.

Methodology of Assessment

The first step was the definition of area of interest followed by the compilation of Earthquake Catalogue from different national and international sources. The catalogues were homogenized, declustered and checked for completeness. Ground Motion Prediction Equations (GMPEs) were selected and the data was processed in a hazard computation software (CRISIS). The output of the exercise was the probabilistic seismic hazard mapping on 50, 100, 250, 475 and 2500 years return periods. The next stage was Sensitivity Analysis of tools used in the study. The last step was Seismic Response Analysis of site soil using strong ground motions records using Deepsoil software. The final phase of assessment was the incorporation of site soil conditions for seismic microzonation to map site specific ground motions.

Historical Seismic Events

For the purpose of seismic designs of buildings, Pakistan has been divided into 5 zones. These zones are based on Peak Ground Acceleration (PGA). Ranges are designed in Table below:

Zone	Intensity	Ground Motion (g)	PGA (g*)
1	Very Low	0.01 – 0.08	0.08
2A	Low	0.08 – 0.16	0.15
2B	Medium	0.16 – 0.24	0.20
3	High	0.24 – 0.32	0.30
4	Very High	> 0.32	0.40

*Where g is acceleration due to gravity

Seismic Hazard Maps Based on Return Periods (50,100,250,475 and 2500 Years)

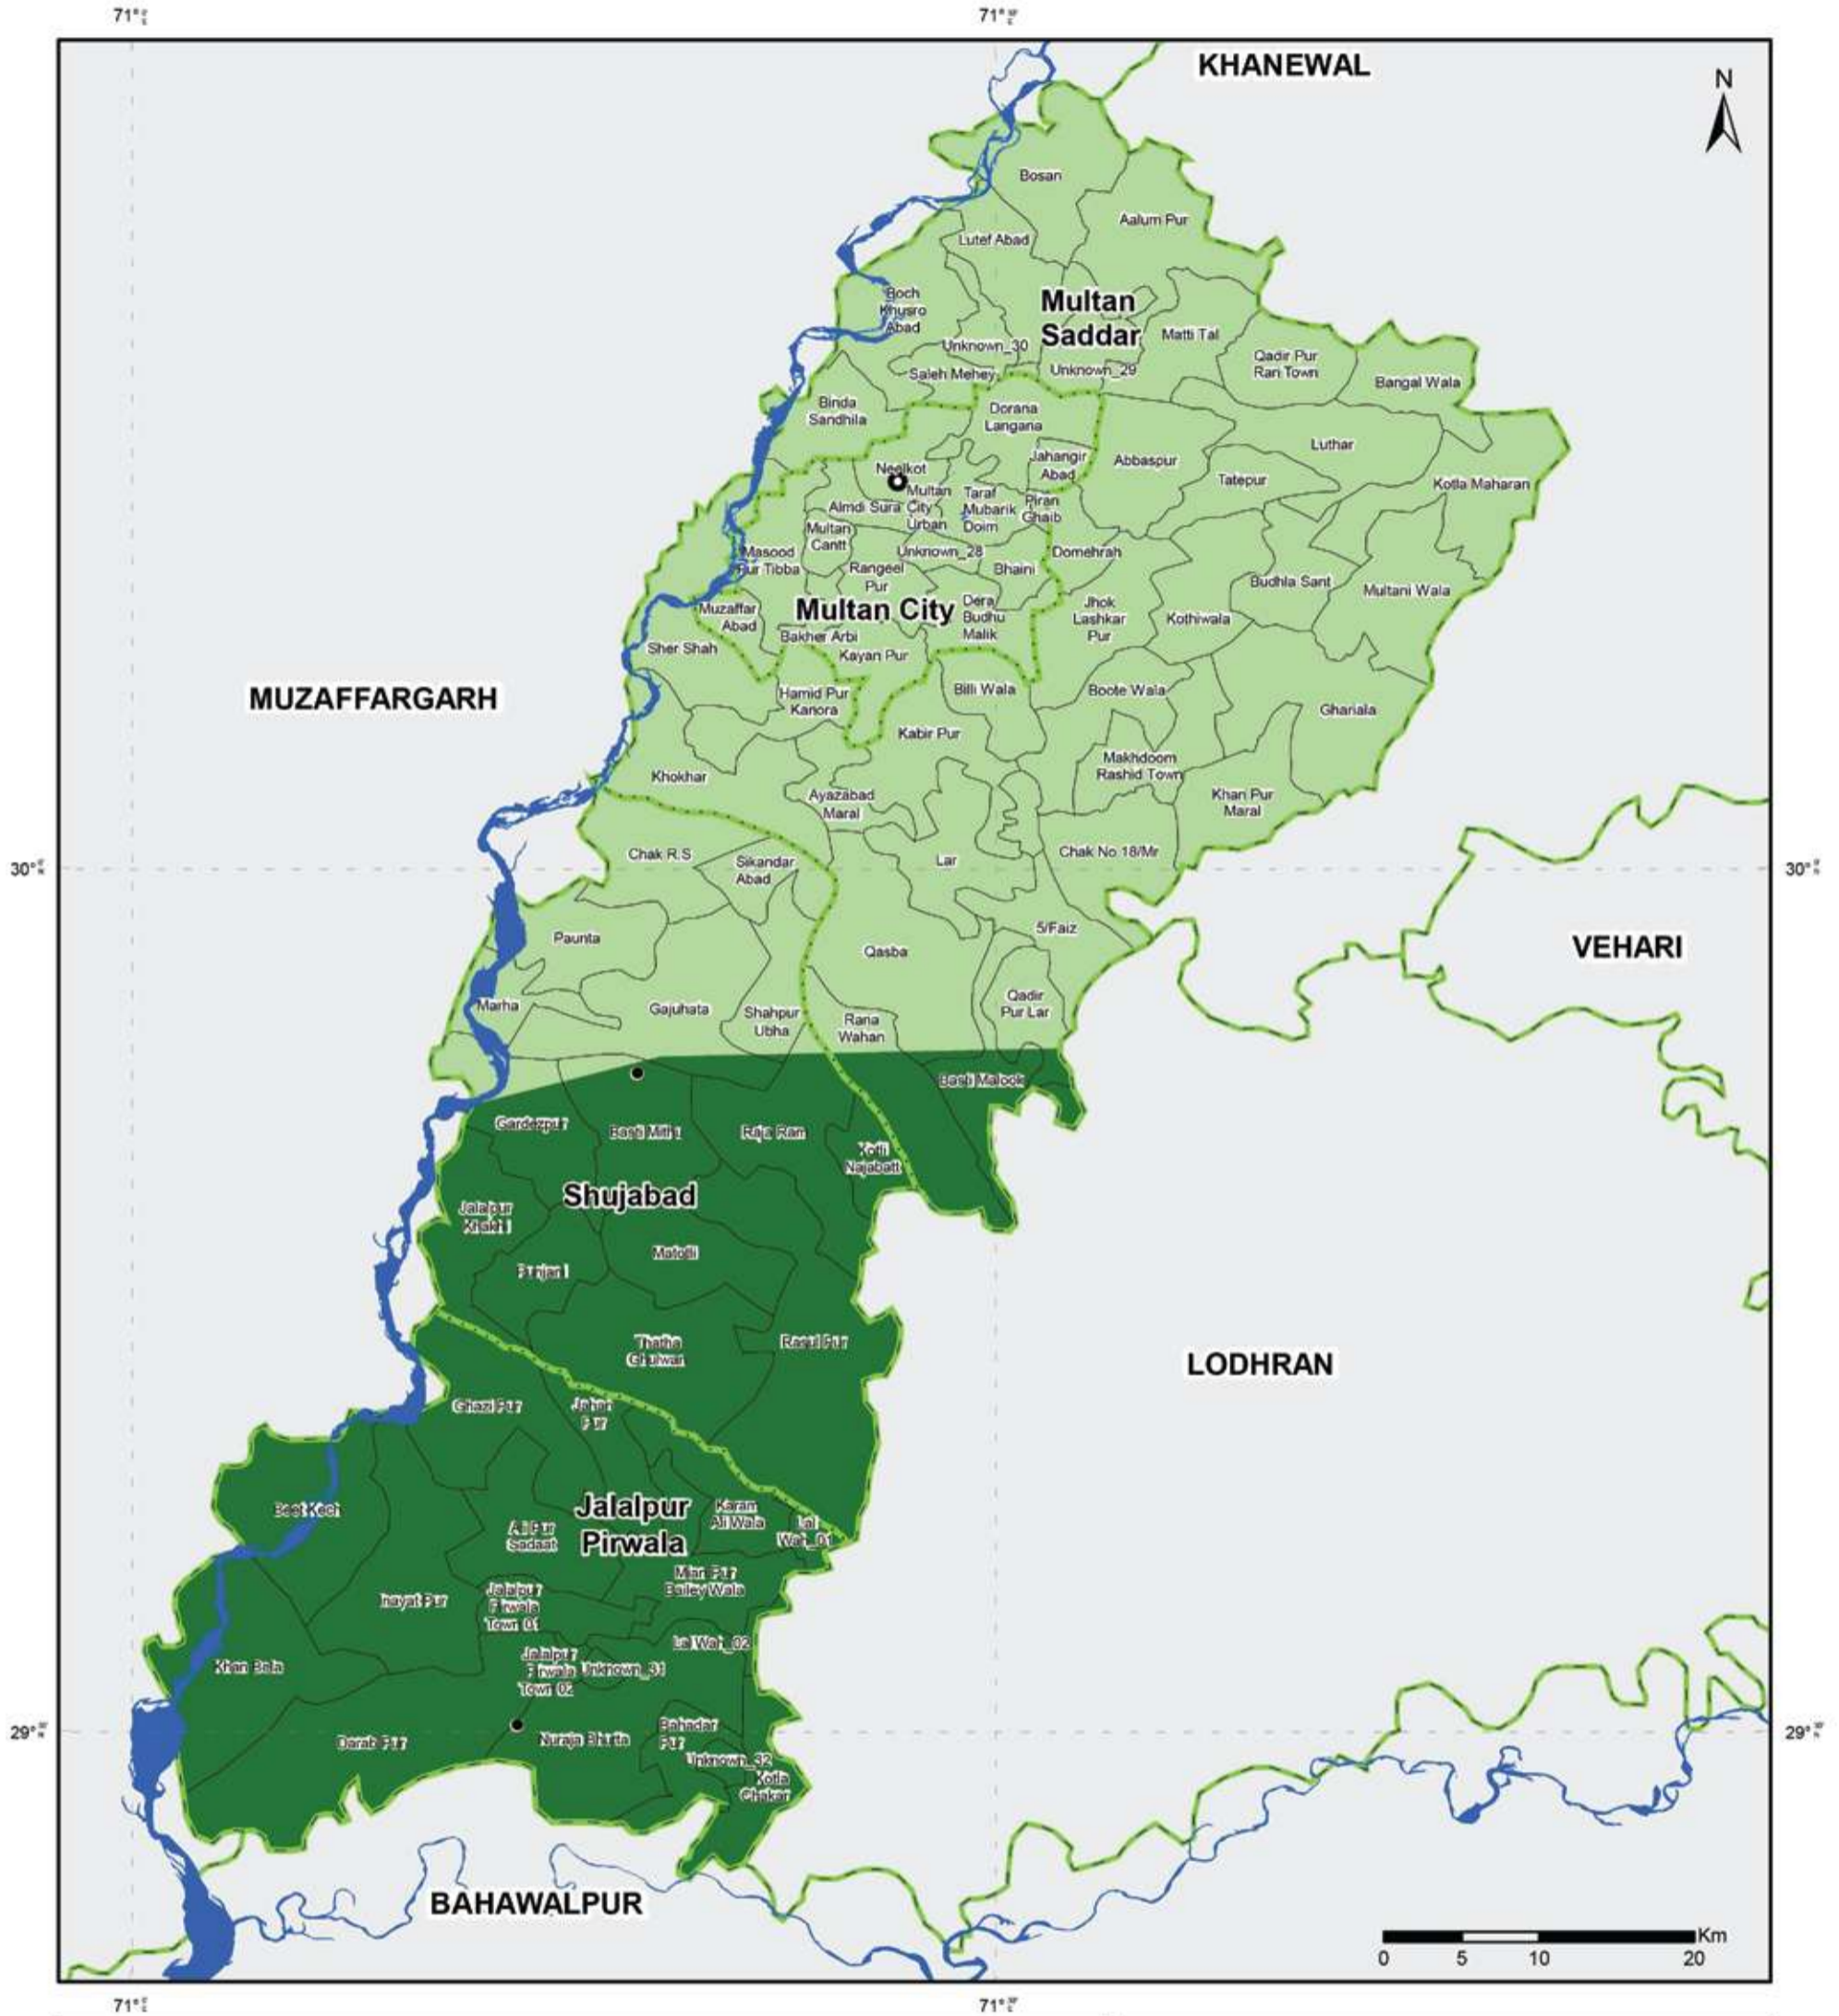

Hazard Zones (g)*

- Zone 1 (Very Low)
- Zone 2A (Low)
- Zone 2B (Medium)
- Zone 3 (High)
- Zone 4 (Very High)

Discription:

Where return period is the recurrence interval of an earthquake. It is a statistical measurement particularly based on previous data.

District Multan mainly has a flat topography with some hilly areas towards north. River Chenab flowing downstream district Jhang, enters into Multan through district Muzaffargarh, passes through the western part of the district and joins River Indus downstream at Mithankot. As part of flood mitigation, following flood protection structures have been put in place:

Flood Protection Structures		
First Line of Defense	<ul style="list-style-type: none"> Fazal Shah Flood Bund Chenab Flood Bund Dhundu Flood Bund 0-26500 Nawabpur Bund Gardezpur Flood Bund RD 0-16 	<ul style="list-style-type: none"> Akbar Flood Bund Jalapur Khaki Flood Bund Shujabad Branch Bund Muzaffarabad Flood Bund Balochanwah Flood Bund

Medium	105	48	5	30	100	36
High	90	44	4	25	90	30
Exceptionally High	88	38	3	22	80	29

In this study for flood hazard assessment, return periods of 10, 50 and 100 years have been taken in account based on probability of occurrence for the flood modelling.

District Multan is situated on eastern bank of River Chenab and northern bank of River Sutlej, and owing to this proximity to both rivers, it is prone to floods. The floods of 2014 damaged over 14,000 houses and over 94578 acres of crops. A detail of historical discharges is as under:

Early Warning & Response Time for Riverine Floods (in Hours)

At Sidhnai Headworks		At Trimmu Headworks	
Year	Discharge (Cs)	Year	Discharge (Cs)
1973	210,339	1973	863,249
1976	244,284	1976	704,635

2014	85,712	2014	626,006

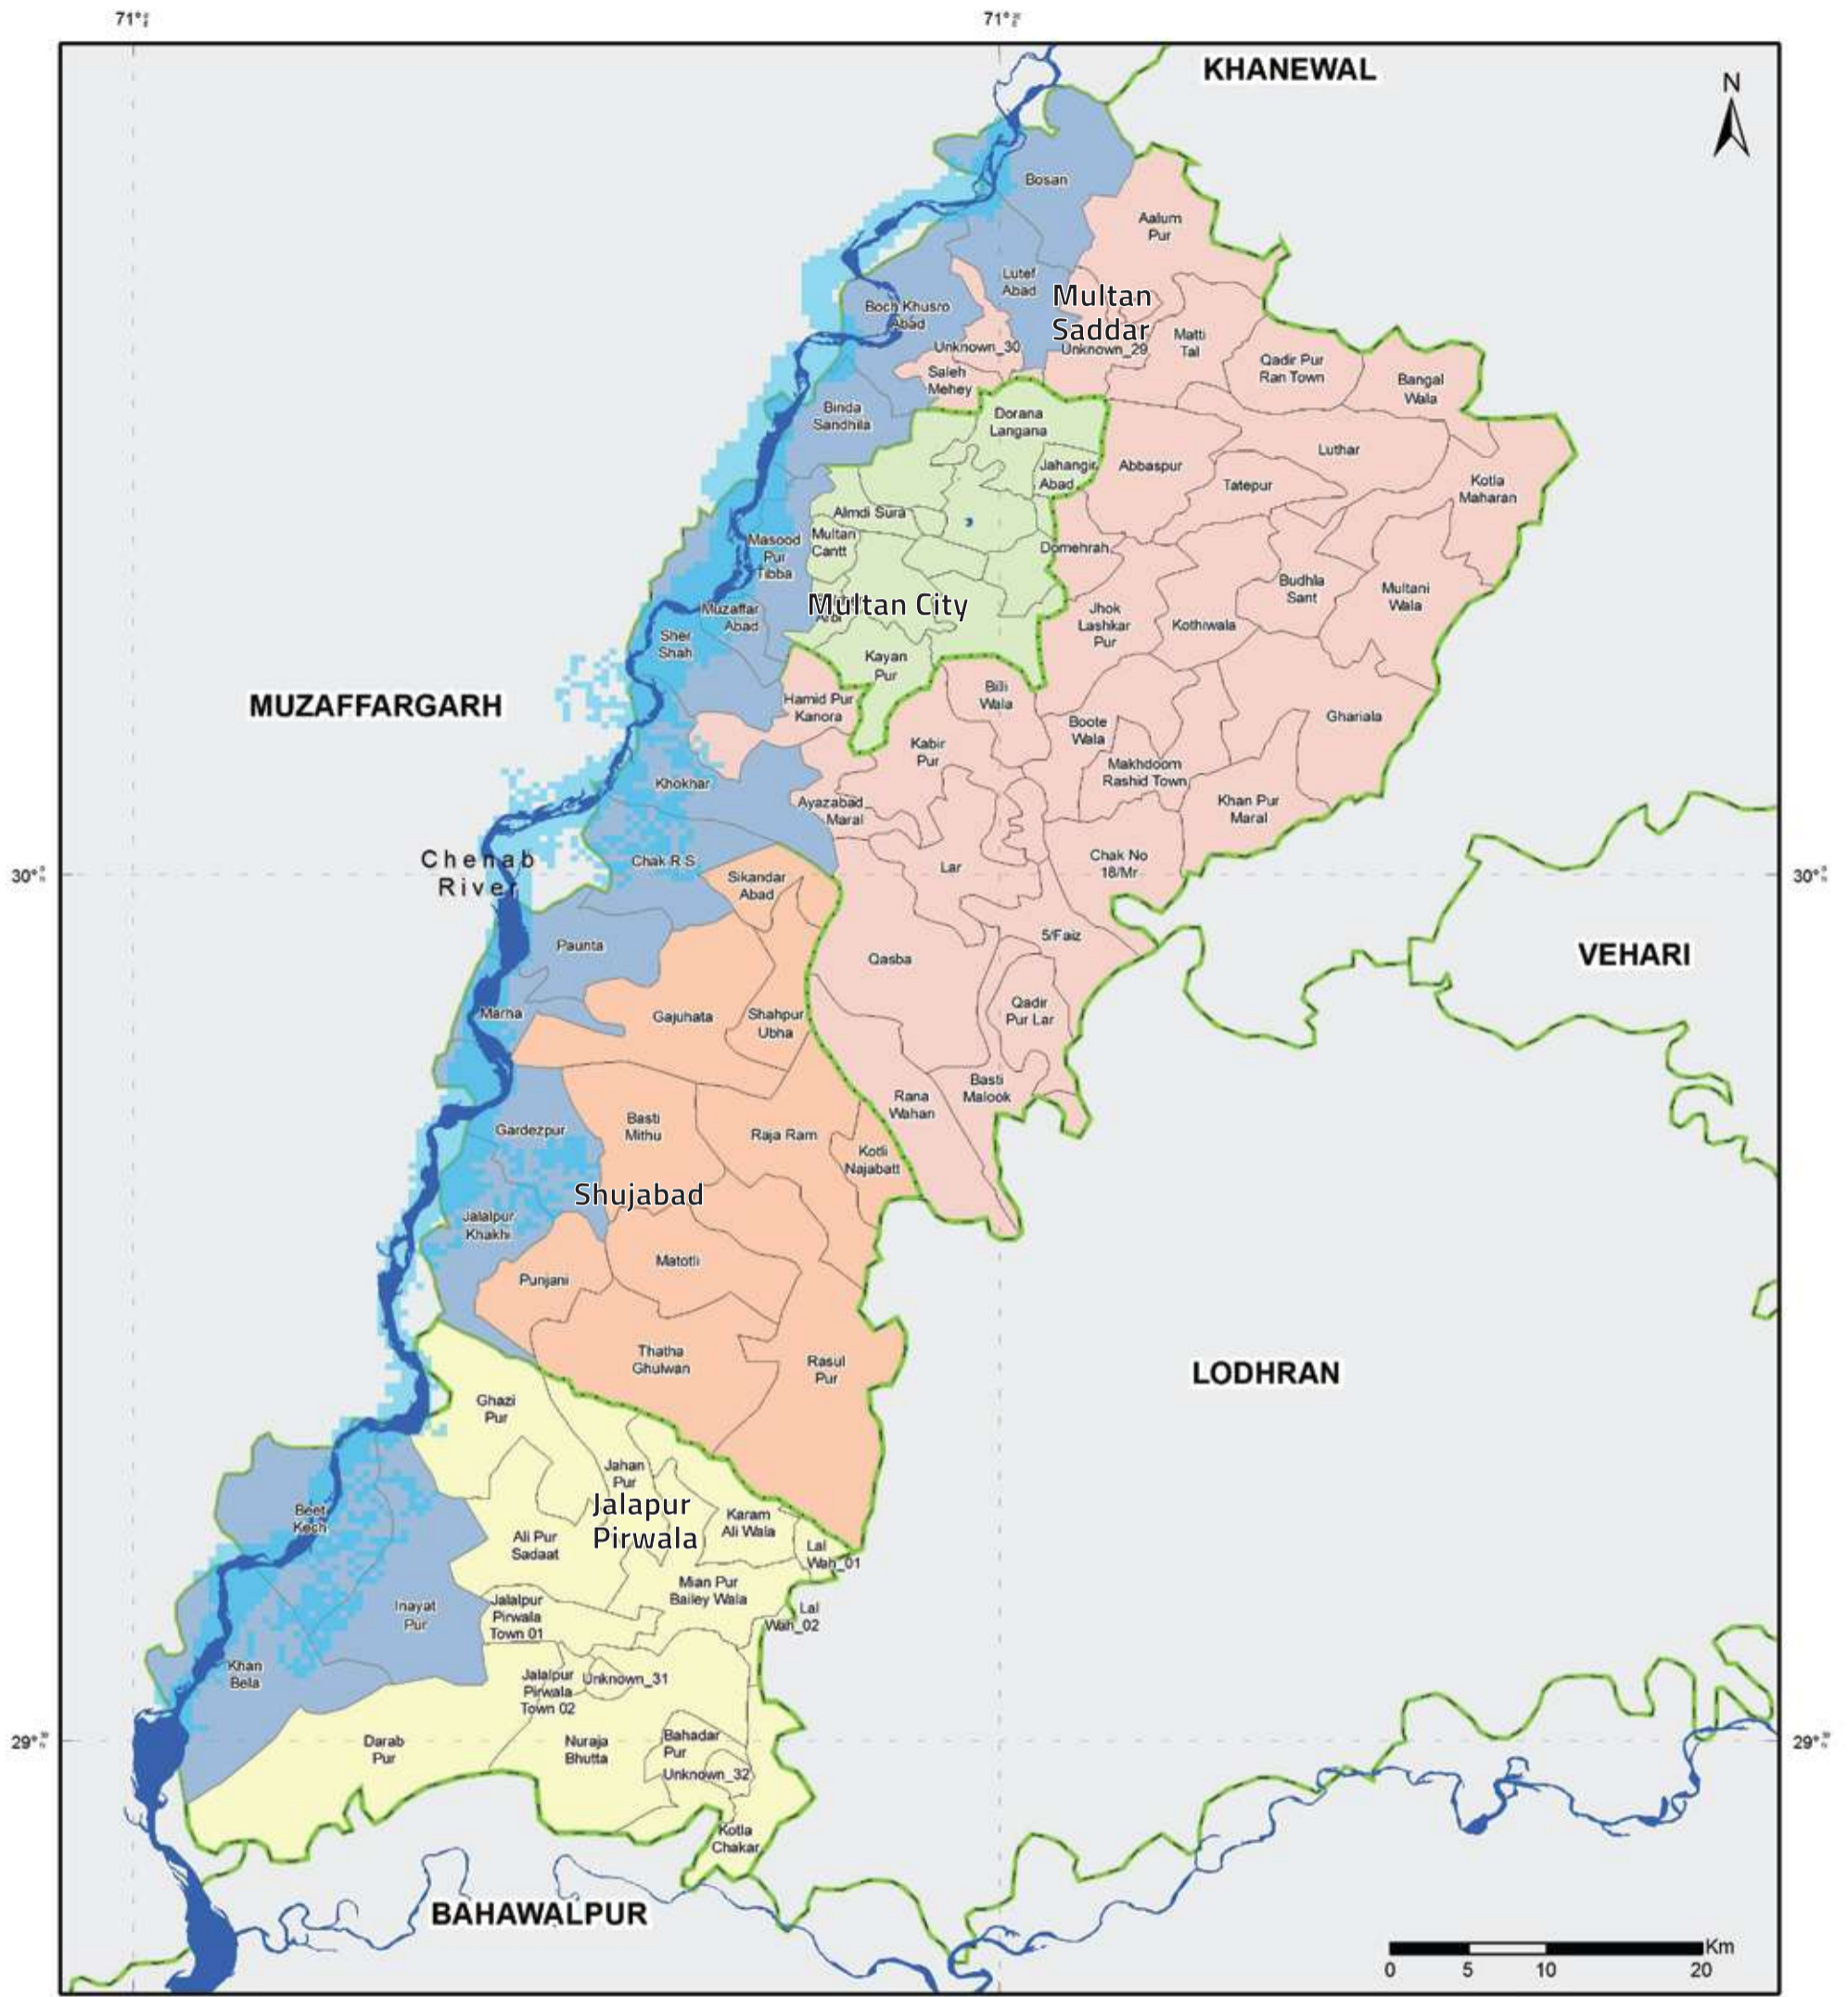

Settlements Vulnerable to Floods based on Historical Inundation Records

Tehsils	No. of Settlements Vulnerable to Floods Based on Inundation Frequency (2010-2015)			
	Low	Medium	High	Very High
Jalapur pirwala	26	31	5	1
Multan City	3	9	3	0
Multan Saddar	20	28	16	0
Shujabad	18	15	3	0

Assessment Methodology

The HEC-RAS hydraulic model has been used for hydraulic modelling of the area, with an average discharge value observed at Sidhnai Head for consecutive years 10, 50 and 100 years as per the return periods. For model inputs, geometric data (stream centerline, flow paths, channel banks, cut lines and cross-sections) has been developed in HEC-GeoRAS. Aster-SRTM DEM has been preprocessed and used for conversion into TIN, to be used as the elevation input in modelling for generation of flood hazard maps.

Modelling results are then processed in ArcGIS for floodplain delineation. Flood hazard maps are then generated as the final result using inundation depth grid and satellite imagery. These maps show the severity of flood hazard at any given point in the area.

D

VULNERABILITY ASSESSMENT

- SOCIAL VULNERABILITY
- FODD SECURITY

Vulnerability Assessment has been undertaken in terms of:

- (a) Physical Dimension
- (b) Social Aspects
- (c) Agro based Food Security

Exposure is defined as the interaction of element at risk and hazard. The hazard severity, extent or magnitude of various return periods indicates the degree to which the elements at risk are exposed to a particular hazard. Primary and secondary sources were used for exposure analysis and it was performed by overlaying hazard information with elements at risk. Elements at risks were considered in the dimensions of population, building, essential & critical infrastructures and livelihood.

Physical Vulnerability Analysis (PVA)

For fragility analysis of buildings the structures are classified into engineered and non-engineered constructions. The engineered structures are analyzed by conducting laboratory experiments on building constituent materials such as brick units, mortar, brick assemblages, brick panels and brick walls for masonry structures and concrete cylinders, reinforcing steel bars, structural beam-column members for reinforced concrete structures. However, the complexity of non-engineered buildings, that depend solely on material properties are not reliable owing to the complexity of structure for modeling. On National scale the construction typologies in Pakistan are primarily based on the type of material used in the construction of walls, floors and roof, and the overall construction quality of a structure typology.

Based on the type used according to EMS-98 the building vulnerability scoring for earthquake and flood hazard are given below where fragility against earthquake is calculated using shake table test and numerical analysis approach, while flood vulnerability scoring is based on historical damage statistics.

Building Vulnerability Scoring

Building Types	EMS-98	Vulnerability Score	
		Floods	Earthquakes
Reinforced Concrete	RC1	2.5	3.09
Stone Masonry	M1	5.4	5.56
Mud/Adobe Masonry	M2	7.14	7.14
Brick Masonry	M5	3.66	3.79
Wood/Bamboo Traditional	M7	4.82	2.50
Block Masonry	M8	4.24	5.00
Others Undefined	00	5	6.25

Building Vulnerability Scoring as per PBS Classification

Building Types	Floods	Earthquakes
Kaccha	6.5	7
Semi-Pacca	5.0	6
Pacca	2.5	3

The damage state of building material based on the repair cost ratio i.e. the ratio of the cost of repair to the total building cost is given below.

Damage State	Repair Cost Ratio
Slight	0 - 5%
Moderate	5 - 20%
Heavy	20 - 50%
Severe	50 - 100%

Buildings Surveyed for Physical Vulnerability Assessment

Social Vulnerability Assessment (SVA)

The Social Vulnerability Assessment focuses on the vulnerability characterization of communities, considering both the vulnerabilities of physical systems and the social conditions that can increase or decrease the impact of disasters in the considered area. The assessment is based on susceptibility of populations to loss, which is quantified using the methodology known as Social Vulnerability Index (SoVI). The SoVI for District Multan is given in the table below.

Factors	Component	Directionality	Variance Observed(%)
1	Age, Education, Health Outcome, Socioeconomic Status	Positive	29.76%
2	Rural Farm Populations	Positive	12.5%
3	Information Access	Negative	6.9%
4	Children with Disabilities	Positive	5.99%
5	Social Benefits	Negative	5.66%
6	Infant safety	Negative	5.61%
7	Low income laborers	Positive	5.31%
8	Poverty/Need for External Income Source	Positive	5.22%
9	Preventative Health Measures	Negative	5%

To obtain a final composite score of social vulnerability, the factors were added to obtain the aggregated factor i.e. the Social Vulnerability Index for each of the District:

$$\text{SoVI Score} = \text{Factor 1} + \text{Factor 2} + \text{Factor 3} + \text{Factor 4} + \text{Factor 5} + \text{Factor 6} + \text{Factor 7} + \text{Factor 8} + \text{Factor 9}$$

FOOD SECURITY AGAINST DROUGHT

Tehsil	Union Council	Drought Severity Score	Area of UC (sq.km)	Agricultural Land (sq.km)	%age of Agri to Total Land	Total Population Rural UCs (98 Census)	%age of Agri Dependent Population	Food Insecurity	Food Insecurity Ranking

INTEGRATED RISK ASSESSMENT

The given study has employed Integrated Risk Assessment Model, as shown in the figure below, for the cumulative risk assessment of study district. The Model takes into account both quantitative and qualitative risk assessment approaches. The methodology is based on multi criteria evaluation as well as analytical hierarchy process. For this purpose, set of indicators for each risk factors have been carefully taken based on the availability as well as the specific context of the study district. In the given methodology four separate dimensions of risk are considered as "factor Components" i.e. hazard, exposure, vulnerability and capacity. To analyze the value of factor components, a combination of quantitative, qualitative and contextual indicators have be assigned to each factor component. Each factor consists of a sets of indicators which cover several aspects of risk. The Risk Index considered a total of 52 indicators to cover physical, economic, demographic, social, environmental and economic dimensions of risk. Specific weights have been assigned to each indicator in order to acutely calculate its impact on risk. The maximum sum of all the elements of weights and indicators can have minimize value of 100, whereas the minimum sum is 0. The risk formula used in the Study is given below:

$$\text{Risk} = (\text{Hazard} \times \text{Vulnerability} \times \text{Exposure} / \text{Capacity})$$

Five classes have been devised to categorize risk between "No to Very Low" Risk to "Very High Risk".

Risk Score	Risk State
>4.1	Extremely High
3.1-4.0	High to very High
2.1-3.0	Moderate to High
1.1-2.0	Low to moderate
0-1.0	No to very Low

Earthquake Hazard Severity Score		
3.0 - 3.9 Richter Scale	1	Very Low
4.0 - 4.9 Richter Scale	2	Low
5.0 - 5.9 Richter Scale	3	Moderate
6.0 - 6.9 Richter Scale	4	High
7 more Richter Scale	5	Very High
0 represents No Hazard		

Flood Hazard Severity Score		
0.3	1	Very Low
3.1 - 6	2	Low
6.1 - 9	3	Moderate
9.1 - 12t	4	High
> 12	5	Very High
0 represents No Hazard		

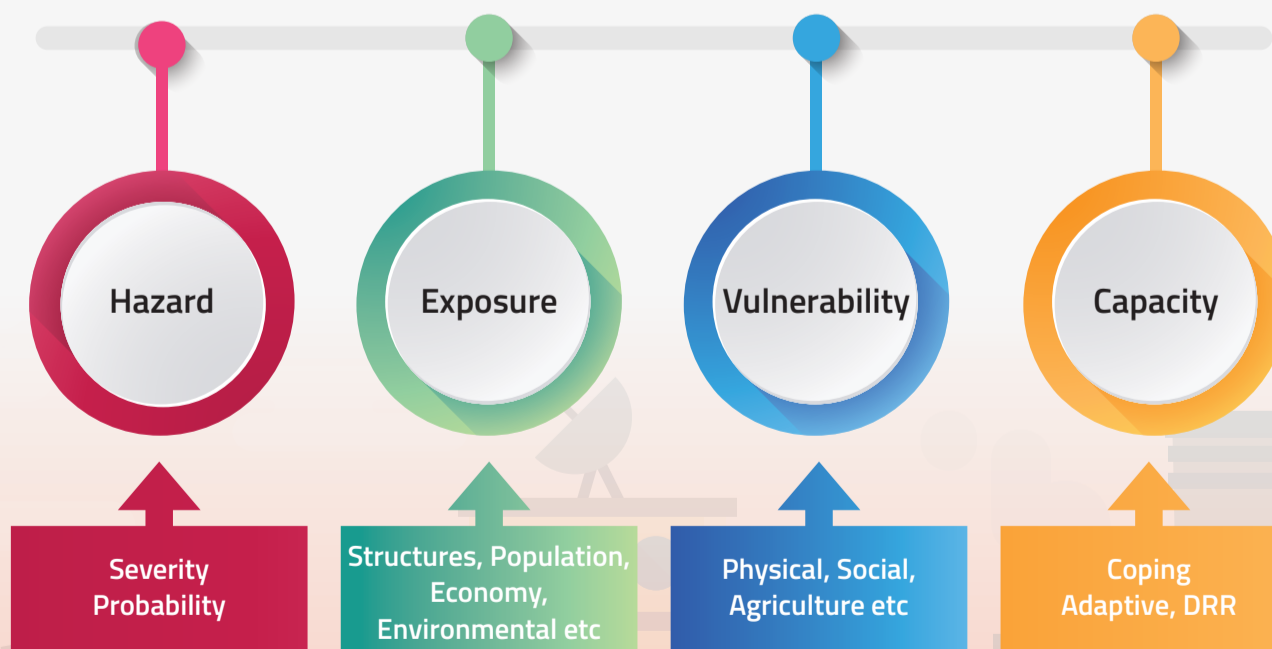

Drought Hazard Severity Score		
No Drought	1	Very Low
Mild	2	Low
Moderate	3	Medium
Severe	4	High
Extreme	5	Very High
0 represents No Hazard		

Exposure Scoring Scale	
1	No to Negligible
2	Low
3	Medium
4	High
5	Extremely High

Vulnerabilty Scoring Scale	
1	No to Negligible
2	Low
3	Medium
4	High
5	Extremely High

Capacity Scoring Scale	
1	No to Negligible
2	Low
3	Medium
4	High
5	Extremely High
