

February 02, 2026

## Heavy Rainfall - Bolivia and Central Brazil

### Affected Areas

Bolivia (Santa Cruz, Beni, Cochabamba, El Alto/La Paz) Central Brazil (Mato Grosso, Goiás, central-west region)

### Hazard Types

Heavy Rain, Thunderstorms, Localized Flooding, Urban Inundation

### Hazard Duration

02-Feb-2026 to 08-Feb-2026

### Hazard Summary

A moist and unstable weather pattern is expected to produce widespread thunderstorms and periods of moderate to heavy rainfall across Bolivia and Central Brazil during the forecast period. These conditions may result in localized flooding, urban waterlogging, and landslides in vulnerable hilly areas. Continued rainfall over successive days could increase runoff and raise the risk of short-term flood impacts in low-lying and poorly drained areas.
